1785. WANTED: Help converting 440Mhz -> 220Mhz

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-20 00:07:22 UTC
From: wy1z@meceng.coe.neu.EDU
Message-ID: <9405200007.AA11354@meceng.coe.neu.edu>
Source record: 226665

I want to build or buy a device to convert 440Mhz down to 220Mhz so I can pick up 220Mhz repeaters and other 220Mhz activity on my scanner or 2m/70cm HT.

Additionally, if I were to connect it to my antenna jack, could I theoretically work 220Mhz repeaters when tuned to the corresponding 440Mhz harmonic?

Thanks for any help anyone can offer.

73,
Scott

1786. Re: EMI/EMC Technician Job Opening/San Diego

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-20 00:36:59 UTC
From: scott@hpsdde.sdd.hp.com
Message-ID: <2rh0nbINNhdo@hpsdde.sdd.hp.com>
Source record: 226657

Regarding my recent posting of this job opening to
rec.radio.amateur.equipment, I've been told this sort
of posting is not appropriate for this newsgroup.

I'd like to sincerely apologize if I in any way offended
any readers of this newsgroup. My intention was to
find a good RFI technician, and this groupd seemed like
the sort of place where good tech's might hang out.

I also posted a copy to misc.jobs.offered, but most of
the postings there look to be for computer science folks,
not hardware-oriented RF types. In fact, I very much
wish there was a group devoted to RFI/EMC/EMI, but so
far I haven't seen one.

So, again, sorry if I offended anyone.

Message-ID: <xeyPdLb.dube2@delphi.com>
Source record: 226678

Dave, you probably have several responses to your request about the HP 205A. But here's my 2cents: I recall a model 205AG in an oak cabinet that was used extensively in military hospitals for hearing tests. The audio generator was a very fine signal gen
erator, providing exceptionally clean sine wave outputs from 20hz to 20khz. When terminated in the correct loads, both the input meter and output meter were very accurate.

I once owned one, and may still have an original manual for it somewhere. I recall getting my hearing checked with this model for many years during flight phisicals in the air Force.

Best of luck,

1789. New MFJ DSP Unit

Out here, the AEA's are losing ground to the KAM+. You may want to give it a closer look, now that G-TOR is here. Haven't used it myself, but I've heard many good things about it's efficiency. Check out PKGold for the AEA and KaGold for the KAM. This is host-mode software that is definately worth considering.

MFJ used to make a device for HT's which plugged between the antenna jack
and the duck which converted 220 down to 144. You might give them a call.

They also made one for the commercial high band. It made your HT hear 150-160.

I don't have MFJ's address, but they're in all the magazines.

I polled the current subscribers and so far the feedback I've gotten
is yes, we should make it include the 1000. I didn't want this to be
a big undertaking, however, in that I don't really have time to
maintain a large list, and I only have a simple alias file here for
it--

If anyone knows where to get a listserver program for SYSVR3/uucp
Unix, please let me know.

1797. Rigs in Hondas

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-20 14:23:31 UTC
From: kevin jessup <kevin.jessup@mixcom.mixcom.com>
Message-ID: <1994May20.142331.1097@mixcom.mixcom.com>
Source record: 226670

Just an FYI for those with Hondas interested in VHF and UHF...

I've had no problems with an Alinco DR600 on high power (45 W VHF, 35 UHF)
in my 1992 Honda Civic LX. Mounted on the passenger side of the center
console. Ran 14 guage wire directly to the battery (also on the passenger
side) through the air conditioning condensor drain grommet in the
fire wall. Have experienced no funny engine operation or accessory
screw ups while operating high power and cruising down the interstate.

Running low-loss coax to a Commet dual-bander on a trunk-lip mount.

One comment on the Alinco DR600 however, it seems to pick up ignition
noise (not too bad) from the Honda. The Yaesu FT2400H (2-meter only)
seemed much less suseptible. I think it was more related to audio
filtering than anything else. The DR600 has better volume and higher
"fidelity". Hope the guys in rec.audio.high-end don't read this! ;-)

1798. Tube's Needed by UT4UX

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-20 14:31:56 UTC
From: victor.silzer@chowda.com
Message-ID: <9405201100271618@chowda.com>
Source record: 226669

Fellows: this is W2LPB, and I am relaying the following message
in the hope that someone out their can assist in this matter...
Lets see if we can assist in our traditional fashion of helping
out.. Vick.. W2LPB.

Dear Amateurs:
I am writing this message in the hope of helping UT4UX "Uri"
In a message that I received on Monday from Uri his Aged Dentron
MLA-2500 HF Amp is putting out only about 300-400 watts due to
the extremely "SOFT" 8875 tubes that are in it.
After a fast talk with EIMAC and some of the "Tube" sellers it
is very clear to me that Uri will not be able to afford the very
high cost of "New" replacements.
In this wideflug and far reaching group a pair of slightly "soft"
8875 tube's must be available for a reasonable cost.
I am willing to FUND the replacement cost of a set of 8875's for
Uri if the cost is "reasonable".
Uri has given many US Hams their first contacts with the Ukraine
and I feel that we may be able to find a way to give something back
especially now with the "soft" Band conditions.
Uri is not asking for charity, the MLA-2500 is working
and only needs a set of tubes.
I will pay the cost for a slightly "used" and reasonably priced set
out of my own pocket and will use the good offices of my
organization to deliver them to him in Kiev the second week of June
when our technicians will be arriving to complete the new Earth
Station.
Please look in your collections and if you have ONE or MORE 8875's
that you are willing to part with PLEASE let me know and I will get
back to you to negotiate the "purchase".
I can be reached at 914-933-6075 any time (Voice Mail)
Thank You in advance for your kind considerations

Source record: 226675

I own an Alinco DJ 580T and in my opinion, anyone that is smart enough
to do the mod, should be smart enough to know what frequency they are on
befort pushing the PTT. I also believe that one would have to violate
radio protocol several times and do it intentionally before the FCC
would even act on a COMPLAINT. They are like most State/Federal enforcement
agencies.....understaffed, overworked, not very motivated.

Just my two cents worth..

Best regards,
Mike

Were any of those 3 other antennas thru-hole mounted?

If not, you've just found the root of your trouble. When I tried a
glass mounted dummy load on my Camaro, its instruments went nuts too.
A magmount caused less trouble, and even radiated a fair signal, but
it took *drilling the hole* and mounting a real antenna to solve the
problem of RF in the cabin.

: while driving is against the law; I think the fine is in the $75 range.
: Several urban counties enacted this legislation a number of years ago before
: the state did, but now it's a statewide law.

It seems I thought Florida had such a rule on the books as well, except I
noticed the other day the guys who drive the county fire trucks always are
wearing headsets, presumably for information/directions, etc.

I guess the question might be are emergency vehicles/drivers exempt when
in an emergency vehicle from this rule (if it exists, I just thought it
did, for some reason).

They probably ought to do something about headsets and joggers/walkers...
I often ride my bicycle along the bicycle/jogging trails (they were on
the books as bicycle paths -long- before jogging trails ever was mentioned)
and I absolutely hate, despise these idiot joggers with their headphones
on their walkmans who can't hear you coming, can hear an "excuse me", they
just keep on puffing at 5mph not able to hear a darn thing! And if you
happened to be in their path, expect to get ran-over. They seem to think
you will shift out of their way (even though they are pedestrian traffic
which should go -around- a stationary item, not over or through it!!).

Yeah, I know this got slightly off topic... Sorry guys,

>
>Out here, the AEA's are losing ground to the KAM+. You may want to give it
>a closer look, now that G-TOR is here

GTOR is a very good mode but it is KAM specific. The ratio of PK232's
to KAM's is better than 3 to 1 (based on QSO records , over 2000
log entries), and the front end of the 232/900 is far superior to
the KAM (have a KAM, MFJ-1278, PTC, PK232 and PK900). I had
to buy a Timewave DSP9+ before the KAM was usable for pactor and GTOR,
the 232 and 900 were at least a factor of 2X better as far as
noise and QRM were concerned.

>Check out PKGold for the AEA and KaGold for the KAM. This is host-mode
>software that is definately worth >considering.

Gold is not the only game in town, XPCOM (twin tnc) for the PK232 (host)
and TNC, XPKAM (host mode for KAM), and XPDUAL (PK900/DSP2232 Host),
ACUTERM and others are also out there offering as much or more
for a heck of a lot less!!

Is 6-meter mobile DX a practical concept? I have been seeing/hearing of sporadic band openings and was curious.

I'm a new ham (waiting for the folks in Gettysburg to print my ticket) and wondered if 6 meters would provide some challenge.

Anyone operating with the new TS60 out there?

I have had a TS-50 for a year...first Kenwood I've been real happy with. It is s fine rig for mobile operation. Lets me do hamming, cbing and swling. I keep as default antenna a 4 foot ten meter whip on a trunk lip mount, and with that setup it is great for swling, etc. I keep a supply of Hamstick antennas in the trunk, just in case i get serious while out and about.

I would not reccomend the TS-50 for home operation. It lacks the ammenities that you would need there, but for mobile ops it is top of its class.

1815. Is it worth re-tubing GLA-1000B amp based on 6LQ6's?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-21 23:33:46 UTC
From: dgf@netcom.com
Message-ID: <dgfCq6EsB.Dzx@netcom.com>
Source record: 226688

I have a Dentron GLA-1000B amplifier (80-15/10, ~600W out from four 6LQ6's).
I'm trying to decide what to do with it - the tubes are pretty well shot and
I'm told that new sweep tubes are expensive, difficult to obtain, and
may not work as well (i.e., lifetime) as tubes that were contemporary with
the amplifier (early 80s). Can someone tell me a good source for good quality,
inexpensive 6LQ6's (this would fix my problem but such a source may not exist),
or should I try to rebuild the amp using real transmitting tube(s),
or should I trash it? If I rebuild it using real tube(s), what tube would
be a good choice for a similar operating point (about 1100V on the plate, about
750 mA on the plate). I've been looking at tube spec sheets and it seems that
most tubes in this power class are designed for higher (2KV or more) plate
voltage and I don't think I have room inside the box for the larger plate
tuning capacitor that would be required. It would, however, make a fun project.

1816. FCC licensing delays

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-22 00:00:00 UTC
From: darryl.linkow@ledge.com
Message-ID: <cf.1448.436.0N2EEB83@ledge.com>
Source record: 226749

Hello all! I have now been waiting for 7 weeks for my first
license to arrive in the mail. Having read all the horror stories
on the nets regarding waiting times, I decided to call the FCC in
Gettysburg and find out what the REAL problem is myself. I spoke
to a very nice woman who told me that it is now taking from 12 to
14 weeks to process application forms because there is only ONE PERSON
keying in the information to the computer. Also, she said that
the "new computer" that people have talked about on the nets is not
online yet. (Hmm...it only took me a couple of hours to set up my
latest 486 box!). At any rate, this ONE PERSON evidently has
thousands of licenses to process. The woman told me that she had
not heard of any offers from the ARRL regarding local volunteers in
the Gettysburg area coming in to help out with the backlog and
enter data into the computer. I told her that since we have
volunteers doing license testing, at no charge to the Federal
government via the VEC program, it seems that we could have
volunteer personnel to perform data entry! She also told me that
the Gettysburg office has requested additional help several times from the
Managing Director of the FCC in Washington, D.C., but the man
refuses to give them any more employees, for even a short period of
time, to clear up the backlog of license applications. I have
called my local Congressman, Representative Anthony Beilenson, and
told one of his staff about the problem. I asked if the
Congressman could contact the Managing Director and ask for some
additional staffing in Gettysburg, at least on a temporary basis,
to get the backlog of amateur radio applications (Form 610)
processed. Perhaps if everyone told their respective Congressman
about the problem, we could get some help! Here is the name,
address, and phone number of the FCC Managing Director who will not
let Gettysburg have any additional people to help get rid of the
backlog: Andrew Fishel
Managing Director
FCC
1919 M Street, N.W.
Washington, DC
(202) 632-6390
Just as an aside, I decided to get my amateur license because of
the problems associated with the January 17 earthquake here. The
American Red Cross had a severe shortage of qualified amateur radio
operators to handle emergency traffic after the earthquake. So, I
decided, as a citizen of the community, that I would get my
license, so that I might get involved in disaster communications,
and be ready to assist, if needed. But, as of right now, I can not
participate in any emergency networks until my license arrives!!

Also, I am routing a copy of the above information to President Clinton and Vice President Gore. I understand that Vice President Gore is very interested in information processing and bottlenecks in those areas of the government that are having problems processing data.

I am open to discussing this with anyone on the net, but if you want to work for the improvement of this problem, please call or write to Mr. Fishel and your elected federal government officials in Congress and The White House.
Sincerely,
Darryl Linkow (no callsign after 7 weeks and don't expect to see one for another 5 to 7 weeks!)

Good point. "Practical" meaning I might be able to work a little DX for a while
at least once or twice a week in the evenings... I would hate to part with
$1K and get no more entertainment than I could with a 2m mobile!

Dave,

Try using 6MJ6's instead. I used an amp w/them and got pretty good life out
of them (>8 years w/heavy use on 80M cw/ssb).

1823. TM-732A: Interesting Behavior

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-22 06:20:37 UTC
From: jdwhite@iastate.edu
Message-ID: <2rmtjl$7nk@news.iastate.edu>
Source record: 226746

I've never seen the following documented anywhere, so I felt I had to share this.

Last night, while playing with my 732, I had a problem with the radio locking up. It would happen whenever I would move the faceplate (which I have remote mounted) around. It finally got to the point where I applied power, "- ON -" would appear on the display, and then it would hang there. I couldn't turn it off or reset it. I took the plastic piece off the back of the face plate and found that the 4-pin connector, which plugs into the head, was loose. I plugged the connector back into the head and powered up the radio. Then it happened.

10 seconds after turning on my radio the backlighting on the display went to full intensity and the display read:

hello
hello

followed a couple seconds later by:

enjoy
hobby

a couple seconds later it went back to the "normal" display except that the s-meters for both units would go from 0 to 12 S-units, then fall back to 0 units in a rise-fall fashion. It would do the s-meter flip-flop thing for about 5 seconds and then go back to the "Hello Hello" part. This looked a lot like the "demo mode" of the TM-742A.

Pressing any key on the face or the mic cancelled the "demo" mode, but if no action occurred in 10 seconds the "demo" mode would resume! I had to do a memory reset to cancel this. A rather interesting experience....

1824. [SUMMARY] PK-232MBX vs. MFJ-1278B

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-22 08:35:25 UTC
From: steve@vigra.com
Message-ID: <STEVE.94May22013525@hobbes.vigra.com>
Source record: 226747
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I got a lot of helpful replies to my recent "PK-232MBX vs. MFJ-1278B" post. Thanks much! Here's what I learned:

Most people strongly prefer AEA's gear over MFJ. Apparently, MFJ's quality control leaves something to be desired. Some have had better luck than others, but some replies indicate that MFJ does much poorer with weak signal HF, and the MFJ leaks significant amounts of RF, which hurts some more than others. The filtering on the PK-232 is much better than the MFJ's, and the tuning indicator is more useful.

Both units are about equal for local VHF packet, where filtering and discrimination isn't too much of an issue. Many recommended checking into the KAM units or PK900 as well, but I haven't yet.

ROM upgrades for the PK-232 are more expensive ($75 + $25 for docs) than the MFJ upgrades ($25). If you plan on upgrading often, this may be an issue.

It's true that only the MFJ does SSTV and shaded Fax, so for those who use it for that, the AEA can't substitute. However, most replies recommended getting a basic Fax-only box if Fax is going to be a significant factor. The AEA-FAX (~$100 hardware & software) is well recommended.

Apparently, AEA doesn't provide or make available any software to decode the Fax data from the PK-232, making it pretty useless. MFJ is a better about it, but doesn't get along with Windows very well. The MFJ software may also be minimally copy-protected, which seems odd.

The internal BBS feature on the MFJ (pbbs) seems a bit better than the PK-232's (PakMail). People like the CHAT command and some auto-forwarding features. It sounds like gobs of RAM aren't really an issue for personal mailboxes with medium traffic.

Overall, it sounds like the PK-232 is a much more reliable unit for Packet and other modes, but if SSTV or Fax are critical, MFJ or specialized boxes are the only option. Many suggested starting with the inexpensive Baycom (~$50), but it only work's on DOS machines.

Thanks very much for all your responses! Especially these helpful folks:

1825. [Summary] Kenwood TH-78A *OR* Yaesu FT-530

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-22 09:05:46 UTC
From: steve@vigra.com
Message-ID: <STEVE.94May22020546@hobbes.vigra.com>
Source record: 226748
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

A while back I was following the thread on the Kenwood TH-78A vs.
Yaesu FT-530, and I thought I'd post a summary of what I learned from
y'all, since it seems there's a few other people out there faced with
the same choice.

First, I had a lot of incorrect info in my post. Specifically:
- The Yaesu digital microphone is NOT alphanumeric.
- CTCSS *does* come standard with the Kenwood in the U.S. Other
countries maybe not, so check.
- The Kenwood keypad *does* light up with the display, just like the Yaesu.

All told, it sounds like the two radios are very close in features.
Only the Kenwood has alphanumeric memory, but it costs you half of
your slots. An expansion to 250 memories (125 alpha) is available,
but the standard memory (50) is less than the Yaesu (82).

The Yaesu has an internal voltmeter, PL tone search, and Vox built in.

Some say that the keypad on the Yaesu is a bit easier to use because
it does't have the sliding cover like the Kenwood. Others like the
cover.

Apparently, the antenna that comes with the Kenwood is not too good,
and it's a little shorter than the Yaesu's. Some recommend a
third-party add-on duckie.

As far as reception, they sound pretty much the same. The Yaesu may
have a little better intermod rejection, but not that much.

The decision???
I chose the Yaesu FT-530, and have had it for about a few weeks now.
I like it very much, but it has a few ergonomic snags. I also did the
recieve-only expansion mod (13 & 15), and it seems to work fine. I'll
probably post a summary of my impressions after I give it a few more
weeks. By then, I may even have paging figured out. :-)

Thanks very much for all your input, especially Marc Wollemborg

Don't trash it. You can sell it to someone else if you decide not to retube it.

You might try Antique Electronic Supply, 602 820-5411. The likely have the sweep tubes. If you secure American New old Stock tubes, I don't see why their life expectancy would not be excellent.

: -George Csahanin
: WB2DYB/5

I got my TS50 in Feb and I use it in the mobile (both ssb and cw) as
well as at home.

The thing that I like most about the TS50 (and TS60) is that most,
if not all, of the features can be maintained/adjusted/toggled from
a main menu. This means that not all of the features have a button
on the front panel. For example, the AGC setting is set from the
menu (ie fast or slow). There are many others as well. And, the
TS50/TS60 have many features in the menu.

Along with this is the four function keys on the microphone. These
function keys can be assigned to any function that can be set from
the menu. For example, AGC, CW-filter, Power setting, etc. etc.
This means that I can change ACG or power or filter... simply by
pressing a button on the mic. I can assign whatever four functions
I want to these buttons.

Once you get the hang of it, it is great!

I DO use my TS50 at home because, being small, it takes up so little
space next to my computer. There is no interference from my computer.

Speaking of size, I use my TS50 on the way to and from work almost
every day. I have built a little wooden rack that sits in the right
seat so that the TS50 wont slide around. Once I get to work, I
simply take the TS50 inside with me. Small is good.

I have a TS60 that I use in the car with a 1/4 wave six meter whip.
It has done very well in the E-skip (2's, 4's, 6's and even a VE3).

If you want to work the local guys on six SSB, you will need a
horizontal polarized antenna. There is a considerable loss when
going from vertical to horizontal polarization.

If you want to work Sporadic-E, it doesnt matter since the polarization
get changed anyway (excuse the non-techie explanation).

So I use the 1/4 wave whip (vertical polarized) on the auto for
everything. I work local FMers on 52.525, the local SSBers with
some loss but I get the Sporadic-E openings with no problem.

Have fun,

Smitty, NA5K

FWIW, I was on vacation last week and took the whole famdamly down south to see the Smoky Mountains' National Park.

We stayed in Seiverville and I got to stop in at TenTec. Paul (WD4somethin') gave me a nice tour of the place. I also ordered the six meter transverter as they were not available yet.

I also got to see the famous TenTec museum where they have one of the few remaining Power Mites (PM-1). That was cool.

Hi ya Bernhard,
your problem is RF getting into your vehicles electrical system, I have had the sam sort of trouble with CB radio, running with RF amp 100 Watt output.
I was useing a magmount aerial but I have now fitted a propper base fixing on the rear wing of the car. Check that the ALL earth cables are tight and clean on the cars battery, also the problem is more likely to with the fact that your aerial is not getting a REAL ground plane These glass mounted aerials work best at HIGH frequencies like Cellular Telephones (UHF) and not down the bottom like 30 meg HF band. You cold try winding down your power to see if this reduces or eliminates the affects..... If you dont want drill any holes in your car, try a mag mount anttena with a wire or earth brade between the mag mount base and some GOOD earth point on your car (like the catch hook of the tail gate.
I hope this is of some help to you.
Good luck.

Have you tried a in line filter in the power lead????? you should be able to pick up one from your local Tandy/Radio Shack store.. Or you could try you local Automotive shop or vehicle cellular/radio fitting shop... Remember to make sure that it can handle the amps as if you get one that is only low power useage they soon cook!!! I know Ive done it. Car full of toxic fumes and LOTS and LOTS of smoke.. (bit like a BBQ)

Well hope you solve you problems... net mail me if I can be of more help.. or you just want a chat on Ham Subjects or anything..

All the best 73's ect...

from pub/hamradio/mods/icom at oak.oakland.edu

icw21 mods:

Receive only expansion:
----
1) Turn radio off
2) Press [B]+[#] switch and turn ON radio.
Depress [B] and [#] only when the display shows all functions and
the radio emits a beep.
3) Go to SET mode and a new function will appear after TONE selection.The
new function is designed by PL. Set PL to "1"for 1 MHz frqcy. enter,
to 10 for 10 MHz frqcy. enter and to 100 for 100 MHz frqcy. enter
resolution.

Note1: This modification does not reset information saved on the CPU.
Note2: Frequency range is 50,0-107,995 MHz FM
108,0-135,995 MHz AM (aviation band)
136,0-299,900 MHz FM
for the VHF portion;
300,0-999,900 MHz FM for the UHF portion.

TRANSMIT EXPANSION:
----
1) Call Icom Parts Dept. and order one diode MA132WK (D.23) for IC-W21AT,
Symbol: MU;
2) Open radio and localize the logic unit;
The logic unit is the half portion of the radio that contains the CPU,
display, keyboard, etc...;
3) Localize some orange colour components in the lowset right part of the
portion, below the CPU shield plate.
Localize the smallest orange colour component. Note a empty place for a
surface mount diode (3 dots) near this orange component (see draw below);

------\ : . <---- Empty place for surface mount diode MA132WK
|oran- \ -----------| | DIAL button

```
| ge / :<>. <---- Surface mount diode | CPU | |
----- / mounted | Shield | | U vol button
^ | Plate . |
| . . | V vol button
|Smallest orange colour component ------|------------|
---PTT,F,Moni..
```

4) Add D23 MA132WK diode in the empty place.
Do use very fine soldering iron and temperature controlated gear.
The circuit is very fragile and may burn if excecive heat is applied.
Take care for static damage also; If you can, use professional gear
for this purpose or find technical assistance of your choice.

-FULL CROSS BAND REPEATER OPERATION-
This feature enables HT to receive on one band and retransmit the content to
the other band. You can even choose tone squelsh selections, repeater offsets
and many other features available during normal operation.
1)Select frequencies on VHF&UHF and options (tones, DUP,...);
2)Set "key lock" by pushing [F]+[C] keys. Then turn radio off;
3)Push [F]+[MONI]+[RPT-M] keys and while holding them pressed, turn radio
on. You will get flashing "L", telling you cross band rpt. is enable.
4)Press [F]+[C] ("key lock" release) and you will clear the cross band rpt.
mode.

==========

The Icom IC W21AT handi-talkie normally receives two bands:
136 to 174 MHz and 440 to 450 MHz.

You can program it to receive
50 to 300 MHz and 300 to 999 MHz.

To do this, turn it off, then simultaneously hold down
the # and the B keys while turning it on. Keep them pressed
for 2 seconds after turning the rig on.

The LCD display will go through a self test, and you'll
then have a wideband receiver. It's not very sensitive
far from the ham bands, but it's handy for listening to
6 Meters or as a portable scanner.

Note that this modification does not require any cutting of
diodes or rewiring -- it's entirely front panel.

1835. Build your own Kenwood remote kit

Newsgroup: rec.radio.amateur.equipment

Message-ID: <1994May22.204036.15522@rsg1.er.usgs.gov>
Source record: 226757

Hello,

I recently bought the Kenwood TM-742 and about choked when they quoted
a price of $85 for the remote kit (for remoting the mike and head). I avoided
this expense by doing it myself. I spliced in 10 feet of shielded 4 conductor
wire into the head cable (per suggestions from several hams). To remote the
mike, I had an electronics store make me a 4 foot RJ45 to RJ45 cable. I then
bought a RJ45 female-to-female adapter. I velcroed (is that a verb) the
adapter under the dash and now I don't have to stretch out my mike cable to
use it. Instead of the brackets provided in the remote kit, I used high
temperature velcro (from Radio Shaft). I thought I'd pass this on to those
looking at the remote kit. Bye...

1836. RX Mod on ICw21AT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-22 22:22:00 UTC
From: David.Edger@f239.n109.z1.fidonet.org
Message-ID: <af5_9405221949@blkcat.fidonet.org>
Source record: 226759

Thanks to several of you who sent me the keypad modification to
open up the Icom W21AT. Having done so,I wanted to report that I am
very disappointed with the sensitivity of this radio outside the ham
bands. I live near a 460MHZ fire repeater and can barely hear it on
the W21AT. It does work more or less using a mobile antenna, but
forget hearing anything with the rubber duck.
I have been fortunate enough to do some comparison on using the
various dual banders for out of band reception. My personal
impressions are as follows:
Standard C558A is tops. Can double as a scanner on
VHF/UHF, and 800 MHZ fine.
Alinco 580T is next best. Hard to get the steps right
on 800 MHZ, but it works quite well.
Yaese 470 is quite adequate, but the modification makes
the radio perform strange for many users.
Tiny Yaesu 41R (single band) is really hot on UHF public
service bands, but no VHF of course.
Icom W21AT, barely adequate although OK inside the
ham bands.
Have not used either the Yaesu 530 or Kenwood 78A.

What a fucking waste of bandwidth. Next time , don't post an image, use a little more descriptive text. And email the image to those intererested enough to reply. Or find an FTP dump somewhere to stick the file. A lot of us use off line newsreaders and get more than a little pissed off to find we downloaded just a bunch of binary data.

For those of you who weren't curious enough to find all the utilities to deal with this crap, it's a front and inside view of a AM/FM transistor portable. At too low a resolution to read anything. I'd put it at about 1967. For that vintage GE radio, judging from a similar AM band one I've got, the model number is on a nondescript little sticker on the inside of the back cover.

There were a one or more annual series of service books for transistor radios of that vintage. I think Rider still published then, and possibly Sams. And at least one other publisher.

Source record: 226774

Doug,

I wish you good luck. The 2m side of my radio went out and I got
nothing but the run-around from Alinco. They would repair the radio
but I remember their prices being very high and an extremely slow
turnaround. I went with a local person here in Colorado after their
lack of interest in my trouble. That was about one year ago.

If it is any help, my tech found that my radio was running extremely
hot, putting out about 7-8 watts on high power. One problem was with
the bnc connecter. The wire connecting in the chassis to the bnc had
become frayed and disconnected. He ended up replacing one of my
final's, reconnected and soldered the bnc wire and brought it back
within 5 watts on high power. The radio works very well now and no
longer burns my hand on long QSO's.
I paid about $70 and had two weeks turn-around. I hope your
experience with Alinco is much better.

Good luck,
Charles

The California vehicle code prohibits covering or inserting plugs in both ears
with certain exemptions. Ham radio is NOT one of the exemptions. Covering or
plugging ONE ear is not prohibited so go for it if you ever visit the Golden
State. As for the above comment regarding fire trucks...emergency vehicles
are explicitly exempted from the ear covering rules in California.

I have an FT290mkII and find it to be an adequate radio. I seldom use the SSB mode unless I take it somewhere. I use it for packet at home. Yaesu offers only a dipswitch PL system that can be hard to use and with only 9 memories it has limited flexibilty. It's a great transportable radio. The 25W amplifier (that comes with it) would be adequate for mountain topping but it needs 5 to 7 amps from a power supply or battery. It has two VFOs that let you tx/rx split and has 25Hz tuning resolution in SSB (although the display resolution is 100Hz).

It would be a good mountain top radio. The accessories you can get can make it great radio for a campsite or for emergency use.

I wouldn't buy a new one. There not worth the big dollars. I see them on the used market quite often in the $300 range. I'm curious...what do they cost new these days?

> rig from AES.
>
This ^^^^^^^^^ is your problem. I bought a DR600T at Dayton from
another dealer and realized that it DIDNOT have the PL decode
board. After a trip to the Cleveland AES store and a ride home (50
miles), I installed the decode board... well as luck would have it,
it didn't work ! When I returned it to the store the next day, the
fellow up front took it back to the "tech" in the back... When he
returned in about 2 min's he said "Your right.. it didn't work."
"But our tech found a solder bridge and fixed it!" I wasn't about
to drive 100 miles round trip to find out how good the tech was....
so I asked for another decoder board. "Fine... just a min."
When he returned, after giving me the new board, asked if he could
put the new double side tape that comes with the decode board in with
the used board.... HE THEN RETURNED THE BAD BOARD TO THE SHELF...Saying
"oh it's ok"..... The last thing I will ever buy at AES !!!

I don't think the original post was by a ham.

Anyway, once you go digital, there are all sorts of ways to scramble.
It was not clear to me exactly what the poster wanted. Books on
how to do a simple DtoA and AtoD conversion? Books on introductory
cryptography?? How to apply a digital bit-stream to an NFM modulator?
What do you want??

As I understand Part 97, it is illegal to encrypt on the amateur
bands if the intent is to hide or obscure the content of the
information. What if one's intent is just to "study" cryptography
as applied to RF communication? ;-))

>--- Comments? Thanx!! 73 dave WB0GAZ dgf@netcom.com

I find my sweep tubes for various linears at hamfests, on the air
swap nets and here in rec.radio.swap. Usually buy them in 5-10
$ range at hamfests. Modifying the amp is not simple as the sweep
tubes had indirectly heated cathodes that had a great deal of
reserve emission for high peak power. If you use a tube such as
an 811, you have to install filiment chokes and drive the filaments
instead of the cathode. You could use 4x250 types by raising the
voltage, or running at reduced voltage, but need screen, grid
voltages etc. Most of the power supplies in these type amps are
full wave rect. You could double the voltage by using the same
transformer in a bridge circuit and putting twice as many filter
capacitors in series in the filtering. Then you might have to
deal with parasitic suppression with different tubes. I
suggest you just keep looking until you find the tubes cheap.
If all else fails, I'll buy it from you and hunt for the
tubes myself. (:>. K9ALD

1860. TS-430 Freq problem. Info pse.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-25 00:24:39 UTC
From: matsuura@renews.physics.mun.ca
Message-ID: <2ru5s7$lq5@coranto.ucs.mun.ca>
Source record: 226597

I have TS-430S and recently it started showing a problem. First, it started frequency hopping. Then TS-430 strated refusing to change frequecny when I turn tunning knob. Freq hopping occurs still intermittently but less frequent now.

Now, freq lock sw works(no freq hopping). Memory sw works. Freq up/down(at MIC connector) works. Program scan works. Band sw works. All these and other functions perform perfectly.

Now I am very suspicious about LED(infrared)s at the tunning(knob) circuit. Actually I stripped my TS-430 and checked around there but no external sign of any bad marks. At that time, I wiggled parts to make sure there were no bad solderings. After putting everything back, tunning knob worked for a while but then above symptom came back.

My question is that

(1) Does anyone have problem like this?

(2) Do I have to have special LEDs to replace existing LEDs and/or do I have to adjust it?

Thank you for your advise/opinions in advance.

This is known as a CLUE. There's an intermittant connection in there, you just didn't find it. It's very unlikely the LEDs are bad, or the photo-transistors. Almost always it's a bad solder joint or cracked trace. Since the flexing you did in disassembly and reassembly temporarily cured the problem, it's almost certain such an intermittant connection is at fault.

The way these optical encoders work, there are two sensors set at specific angles to each other so that one is obscured by the pattern on the knob before the other. They generate two pulse trains shifted in phase when the knob is turned. Depending on which phase leads/lags the other, the direction of rotation is determined. One of the phases is counted to give rate.

Take a scope and watch the two phases. The one with the glitches is the culprit. Note you can use a simple pulse catching logic probe instead of a scope. Attach it to one output and wait for the transceiver to "hop". If it catches a pulse, you've found the culprit. If not, put it on the other output and wait. Once you know which phase is intermittant, use the standard technique of reheating solder joints and running the tip of the iron along traces to get rid of the intermittant. (The intermittant could also be in a cable harness. Ring these out with an ohmeter while flexing them to locate the problem.)

Message-ID: <1994May25.124956.13767@mixcom.mixcom.com>
Source record: 226782

I've got two Yaesu FT2400H 2-meter mil-spec mobile rigs. An excellent unit. The speaker could be a bit more robust, however.

I see Yaesu now has the replacement available: the FT2500M. I saw it on display at AES in Milwaukee the other day. Looks built like a tank. Very similar to the 2400. Looks like just a face-lift. Supposedly has the latest version of their "advanced track tuning", which the FT2400 also has. Curious if the electronics have really changed at all or if this is strictly cosmetic. Can anyone else provide any info? AES had know idea if there were any performance changes. Thanks for the help. 73.

BTW, the 2500 was going for around $350 or $360.00. The nearly identical 2400 is still at $299.00.

1870. More Alinco DR600 bugs!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-25 13:22:13 UTC
From: kevin jessup <kevin.jessup@mixcom.mixcom.com>
Message-ID: <1994May25.132213.14820@mixcom.mixcom.com>
Source record: 226785

In the ongoing saga of my Alinco DR600 woes...

The DR600 allows full remote control via DTMF tones from any remote radio that supports them. Digital squelch (DSQ) security codes can be enabled (up to 3 digits) to provide "added" security prior to sending any DTMF tones that would change operating parameters.

Thing that can be changed remotely are power levels, cross band repeat enable/disable, active memory channel and more.

So here's the problem: It seems smart to enable DSQ on your crossband simplex channel (70 cm band if you want to crossband into a 2-meter repeater) to avoid any spurious signals or junk from crossbanding over to the 2-meter side. Note that PL DEcode is not standard. BUT, you'd like to enable the DSQ function (with your 3-digit code) on the 2-meter side as well. This prevents DTMF tones that may come from the repeater from reprogramming your radio. Unfortunately, since the repeater does not send out your 3-digit DSQ code, you will not break squelch on your 2-meter side and cross-band over to 70cm. This kind of defeats the purpose of crossbanding! Therefore, the only option is to have DSQ DISabled on the 2-meter repeater side of the DR600. This means that any tones that come out from the 2-meter repeater can potentially be interpreted by the DR600 as commands. (The DR600 accepts remote programming commands on BOTH sides, VHF and UHF. You cannot select which one. It's both or nothing! :-((

This happened to me when the repeater I was listening to on the 2-meter side had it's DTMF controller temporarily disabled. All DTMF tones heard on the repeater's input were then passed right on through to the output. Well, some jammer was on randomly hitting his DTMF pad. He hit a seqeunce that bumped my UHF side from my crossband simplex channel up one memory location to a UHF repeater. My DR600 then happily crossbanded anything on the UHF repeater over to the 2-meter repeater. This went on for about 5 minutes before I ran out to the car and shut the damned thing off.

I called Alinco and the service tech said there was a bug fix to prevent your radio from moving off of frequency. I asked him if this fix allowed use of the security code on both sides (UHF and VHF) but still did not squelch the output of the signal you wanted to here. I could not get a straight answer. Anyone else with a DR600 who can help me here?

Thanks for your time and patience reading this rather long desription. I hope it was clear enough. I really don't want to send in my 1-month old rig if the problem will not be resolved.

One final note. The DR600 can be placed in crossband repeat WITHOUT remote functions enabled. It's rock solid then. You just cannot change anything remotely. All controls must be adjusted from the front panel. This is my current configuration. I;ve given up on remote control of this thing. Too bad that is the reason I bought it. I also have an Alinco DJ580T HT that I am VERY happy with. Maybe I got a lemon?? I doubt it. Probably poor software design.

I hope that this doesn't indicate a change in TenTec's way of doing
business.

They've been the business stand-out in the past, and I hate to see them
selling things that they can't ship.

>After putting
>everything back, tunning knob worked for a while but then above
>symptom came back.

Right there is a BIG hint. I'd say that you have an intermittent connection, either a bad solder joint or some dirty contacts in the multipin connectors. The rig is old enough for corrosion to have formed, so I'd bet it's one of the multipin connectors, and probably the pins carrying the data from the tuning encoder, although it could be ground pins or possibly the V+ pins.

I clean the pins first with a pencil eraser, then I polish the contacts with a cotton cloth. A little alchohol on a cotton swab will help by removing oil and grease, common if the rig was owned by a smoker.
Getting at the female pins will require removing them from the housing or finding some real small pipe cleaners, but I've used cotton knitting yarn with success. I wrap it on a toothpick and twirl it in the contact.

I hope this has been helpful,
Galen, KF0YJ

1873. Re: Yaesu FT840 or Kenwood TS140

Message-ID: <2rvp85$n7a@nyx10.cs.du.edu>
Source record: 226791

I own neither an FT-840 nor a TS-140.
I do own an FT-747GX ...
The original QST review of the 747GX mentioned a couple of problems.
Those problems appear again in the 840. But I bought my 747GX about six
months after the review appeared, and by that time Yaesu had fixed them.
I am really plesed with my now four year old 747GX.
I have used the TS140 in a couple of Field Day operations.
I work CW only, so I know nothing about its SSB performance.
I detested the TS-140 on CW. The receiver did not have the smooth sound
I find in the Yaesu or in older radios (Drake, especially). The radio
sends a `popping' noise through the audio output whenever you tune across
a 50 khz boundary (xx.000 or xx.050 mhz).

By now you can see that I prefer the Yaesu.

Source record: 226793

The TS430 has a reputation for connectors going dirty. Easy to fix, just open the whole thing up and slide them on and off a few times. This fixes an amazing variety of faults.

There are also reputed to be occasional problems with dry solder joints in a couple of places in the power amplifier.

I've seen a couple of cases where VCOs have drifted a bit and need a re-tweak to get the synth to lock over its full range. Loss of lock inhibits TX at freqs where the VCO runs out of tuning range.

Cheers
David GM4ZNX

1875. Packet radio inquiry

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-25 17:40:24 UTC
From: verdant@twain.ucs.umass.edu
Message-ID: <2s02i8$b1k@nic.umass.edu>
Source record: 226794
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

Hello,

My organization will be buying some telecommunications soon, and one of
the options we would like to examine is setting up a packet radio link.

Here is the situation: Our campus operates on a digital phone system,
and the people who run the digital phones are very stingy about giving
out analog lines. We would like to have an analog line to set up a fax
modem. Barring this we would have to spend about $350 extra to get
something called a Terminal Adaptor Unit installed, and that would give us
9600 BAUD connection to the local computer network on a separate data line,
but no fax capability. (Not to mention the phone itself costs around $200)

The idea occurred to us to use a packet radio to link to a volunteered
data-line. They undergrads are given free digital datalines in the dorms,
and we may have a member off campus, even better, willing to install an
analog line and set up our computer's fax modem there. This would be
cheaper and preferable. We may even be interested in a second radio
which would send/receive voice calls on an off-campus phone, but we would
probably like to scramble the signal.

Any suggestions? Assume we will not be able to put up an outdoor antenna(sp?)
Also, we would like something more or less pre-packaged and simple. Assume
a budget of $300 for the packet radio and $200 for the voice radio. I am
clueless as to how much these things generally cost.

Thanks for any help.

Brian

From: hcooper@moons.sim.es.com
Message-ID: <2s03bq$qp7@moons.sim.es.com>
Source record: 226596

I know that you may broadcast license free in the AM broadcast band,
but at what power levels and are there frequency restrictions?
I would imagine that you would pick a freq away from any broadcasters
present on the band, but how about power?

Who makes the transmitters? Ramsey comes to mind, but I don't have a
catalog. Anyone have a schematic/info on building one?

Same questions for the FM broadcast band - like the wireless mics. I assume
no freq limit again, but what about power levels, antenna restrictions, etc.

Thanks for the info (email response prefered)

-Harrison

1878. Motorola GPS engine purchase information

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-25 18:13:58 UTC
From: bonomo@specxn.enet.dec.com
Message-ID: <1994May25.181358.11959@nntpd2.cxo.dec.com>
Source record: 226598

Greetings, one and all!

This message is ASCII text, formatted as <CR> at =<78 characters, tabs at +8.

Have finally received "everything" which I will obtain from Motorola and Trimble, and the order requests have dwindled to a minimum, I have attached the specifications and pricing below.

In a nutshell, the Motorola unit is better in every way, excepting three factors. The Trimble unit:

1) is about 1/8" smaller in width and height,
2) is about .6 ounce lighter,
3) consumes less power in standby, quoted as ~2uA nominal, versus the Motorola's stated maximum of 60uA.

Other than that, the Motorola VP Oncore engine is superior in all ways, including price. The recommendation, from my perspective, is to choose the Motorola unit, but your choice may vary. The above factors, in which the Trimble unit is superior, may be significant ones for you.

I have had requests from 375 individuals, from nine countries, for over 435 units. All this is, of course, based on a "$150" purchase price, which is not available.

Understanding this, it seems best if there is a "standard" configuration which is ordered, as the pricing given is for quantities of 100 and greater. If 100+ want the options, we'll order those, too. Remember, all prices are for 100+ units per item. In other words, if 25 units are wanted with the LNA option, the pricing for that LNA option will be be somewhat higher than the figure quoted below, and I'm not sure if Motorola can (or will) handle one-sie, two-sies and get it right.

****
The recommended "standard" configuration:

Item Price / each (includes Colorado State sales tax)

VP Oncore engine $268
Active Antenna $ 70
Cable to antenna $ 22

Total "standard" $360

****

Options to be considered:

LNA $ 16
battery $ 11

Shipping within the continental U.S., via 2nd day service, will run $10. This includes a box, packing foam and shipping charges. This figure is good for up to ten units.

Those interested in this group purchase should remit monies to the name and address below. Please send non-cash such as personal checks, money orders or the like, as it allows records to be kept much more easily. If less than 100 orders are placed, the checks/money orders will be destroyed, rather than incurring the cost of returning up to 100 of them. Alternately, if you want your check returned in the event of an insufficient number of units ordered, add a dollar bill to cover the cost of an envelope, stamp and my or my wife's writer's cramp which will inevitably result. If the order threshold is reached and an order is placed with Motorola, the $1 will be returned to you with your order. Please include a very complete address to which the order may be sent. Include your current Internet address and telephone number(s) where you may be reached, as well. I've experienced several Inet addresses which have bounced, by the way, so if you didn't receive a response from me directly, it was attempted.

Send orders to:

Thomas A. Bonomo
8147D Summerset Drive
Colorado Springs, Co. 80920.6123

I can be reached, and have been by several individuals, at:

Telephone: (719)593.9883 Home (evenings, weekends)
(719)592.5105 Office (weekdays)
Internet: tom.bonomo@cxo.mts.dec.com

This message will be posted to the newsgroups, as well.

Thanks for your patience as I've gathered information and responded to each of your requests.

Regards,

Tommy

Specifications and pricing information follows.

Motorola VP ONCORE SPECIFICATION DATA SHEET

Receiver Architecture
----
o 6 channel

o L1 1575.42 MHz
o C/A code (1.023 Mhz chip rate)
o Code plus carrier tracking (carrier aided tracking)

Tracking Capability
---
o 6 satellite vehicles simultaneously

Dynamics
---
o Velocity: 1000 m/s when altitude less than 18 km
o Altitude: 18 km for velocities greater than 514 m/s
o Accelleration: 4 g

Antenna
---
o accepts active and passive antennas

Acquisition Time

(TTFF = Time To First Fix)
o 22 sec. typical TTFF (with current almanac, position, time and ephemeris)
o 48 sec. typical TTFF (with current almanac, position and time)
o 2.5 seconds typical re-acquire

Accuracy
---
o Position: less than 25 meters, SEP (without SA).
DoD may invoke Selective Availability (SA), potentially degrading accuracy to 100 meters (2 dRMS)

DATUMs
---
o 49 std. datums, 2 user defined, default WGS-84

Signal Level
---
o TTL

Output Messages
---
o Latitude, longitude, height, velocity, heading, satellite tracking status (Motorola Binary Protocol)
o NMEA-0183 Version 2.00 (GGA, RMC, GLL, GSA)
o LORAN emulation mode
o Software selectable

Operating voltage
---
o 4.75 - 5.25 VDC, 50 mVp-p ripple

Operating current
----
o 230 mA typical @5V, 275 mA max at 5.25V

Standby voltage
----
o 2.5 - 5.0 VDC

Standby current
----
o 60 ua max

Dimensions
----
o 2.00" x 3.25" x .64" (50.80mm x 82.55mm x 16.26mm)

Weight
------
o 1.9 oz. (53.9g)

Connectors
----
o Digital: 10 pin (2 x 5) header on .100" centers
o RF: right angle OSX (sub-miniature snap-on)

Operating Temperature
----
o -30 - +85 degrees C (without on-board battery)
o -20 - +60 degrees C (with on-board battery)

Storage Temperature
----
o -30 - +85 degrees C (without on-board battery)
o -20 - +60 degrees C (with on-board battery)

Humidity
----
o 95% RH, non-condensing

Vibration
----
o 7.7 g, random (survivability)

MTBF
----
o >61,000 hours (estimated)

Optional features
----
o Lithium battery
o Low Noise Amplifier
o Real Time Clock

Pricing (includes Colorado state sales tax)

VP Oncore engine $268
Active Antenna $ 70
Cable to antenna $ 22
Low Noise Amp $ 16
Lithium Battery $ 11

Development Software
1st option $270
includes:
Raw code phase,
disc data,
smooth sat time,
carrier phase

2nd option $215
includes:
above without
carrier phase

Specifications for Trimble SVeeSix GPS engine

Model: SVeeSix-CM2

General

L1 Frequency, C/A code (SPS), 6 channel, continuous tracking receiver

Update Rate

NMEA - 1Hz

Accuracy

Position: 25m without SA
Velocity: 0.1m/s without SA
Time: 1 us (nom)

DGPS Accuracy

Position: 2m to 5m (2 sigma)
Velocity: 0.1m/s
Time: 1 us (nom)

Acquisition (typ)

Cold Start: 2 to 5 minutes
Warm Start: 50 sec with time upload
Hot start: 30 sec with time upload

Reaquisition

<2 sec

Dynamics

Velocity: 500 m/sec max
Acceleration: 4g
Jerk: 20m/sec^3

Environmental Specs.

Operating temp: -10C to +60C
Storage temp: -55C to +100C
Vibration: 0.008g^2/Hz 5Hz to 20Hz
0.05g^2/Hz 20Hz to 100Hz
-3dB/octave 100Hz to 900Hz

Operating Humidity: 5% to 95% RH non-condensing @+60C
Altitude: -400m to +18000m

Physical Characteristics

Dimensions: 3.25" x 1.83" x 0.58"
Weight: 1.3 oz. (36.4g)
Connectors: RF: SMB, I/O: 8 pin (2x4), 2mm header

Technical Specifications

Prime power: +5Vdc (-3% to +5%)
Power consumption: 280 ma, 1.40 watts
Backup power: +3 to +5 Vdc
Backup consumption: 1 uA @3V and +25C (nom)
Serial port/1PPS: CMOS TTL
Protocol options: TSIP @9600 baud, 8-O-1
NMEA 0183 v2.0 @4800 baud, 8-N-1
TAIP @4800 baud, 8-N-1

NMEA messages: Standard: GGA,VTG
Optional: GGA,GLL,VTG,ZDA,GSA,GSV,RMC

Pricing (includes Colorado state tax)

SVeeSix CM2, DGPS capable $321
Antenna (includes cable) $118

> The other option is to build a rx converter for my 10M all mode
> (Hamtronics has a kit for this).

Ok, I'll try this one again; my 1st followup blew up. I'll X-post to equipment too. I asked this question a few weeks ago, bought the rig, and put together a summary. Oh and I tried it on RS10, mode A SSB. Heard my own signal well, but need to get used used to tuning 2 rigs :-) Here's my summary:

Hi, thanks to all who responded to my questions about the FT290. I ended up buying the radio on Saturday.

The following comments were received:

Several complained about inconvenient tuning. You must choose modes by repeatedly pushimg the mode button. Going thru FM forces the VFO to an even 5khz (?). The workaround is to keep one VFO set up for CW and one for SSB.

This is awkward. So is memory operation. I like being able to store "band markers" in memory. On my Yaesu HF rig (FT747GX), I go to the mode and approx. freq where I want to operate by doing a MR, and dump this into a VFO. Then I use the VFO to tune from there. That won't work with this radio. You can't tune off of the MR'd freq. You can't dump the memory back into a VFO. My FT470 HT also has the ability to "Manual Tune" off of a memory recall. Maybe I missed something in the manual. Maybe I just need to change my habits a bit.

It would be nice, also, to have built in CTCSS encode that can be stored in memories for FM. PL encode is an add on option that is dip switch programmed.

1 reported low sensitivity. Sensitivity seems very good. This is purely subjective so far. I have nothing to compare it with. I don't have the equipment necessary to measure it, or an effective antenna either. (Thats my next project!)

1 reported problems from strong inband signals. Have not noticed this yet. My location is fairly quiet though. It will be interesting to see what it's like when I get this rig up on some ridge in the Pocono Mts.

1 report of rough transmit audio. My reports have been great so far.

1 reported that the FT790 (70cm brother) was drifty.

1 complained that the ant connector on the amp is hard to reach. Yup - it's nestled way down in there between heat sink fins. I don't mind this because I only use the amp at home. Never have to remove the connector.

1 reported that the key and speaker connectors may be non-standard size. They seem loose on his. I think this has been fixed - mine seem ok.

1 reported that the DTMF buttons on mic are easy to bump. I can see where this could easily happen. I'll probably use my other non-DTMF mics unless I'm FM'ing.

One commented that he wouldn't buy one new. He's seen them in the $300 range. The cheapest I've seen them used is for about $450 used. At that price, it seemed woth it to spend the extra $100 or so and buy it new. So I did.

Positive comments:
In spite of a few negative remarks, most seemed happy with the radio. It's lightweight, compact, and fills a need that no one else is currently addressing.

Several commented that the receiver sensitivity is good.

Most commented favorably that the packaging is neat - that you can unclip the amp, snap on a battery pack, antenna and shoulder strap and go in the field. And it works ok even as a base. This is really why I settled on this radio.

Now it's time to go back to the antenna books, and look up those articles on portable beams/quads!

Thanks again to the following who responded: KD6EFQ, W7GZ, G4HLX, N3OWJ, N9RPT, KD6ELA, and Sam (Sorry, didn't get your call).

1880. Converting an old HT-220 to 2M

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-25 20:33:49 UTC
From: usenet@oracle.us.oracle.com
Message-ID: <1994May25.203349.11883@oracle.us.oracle.com>
Source record: 226605
Cross-posted to: rec.ham-radio,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I have a Motorola Ht-220 Type CC3540 Serial # L06K2D Model H33FFN1100E.
It transmits and Receives on 163.5375 MHz. It has a 15 Volt NiCad. It is
crystal controlled. I would like to convert this to 2 meter. Does anyone
know how I can do this? I should be able to swap out crystals, shouldn't I?
The numbers on the crystals (as best as I can tell) are:

xmit: 18170.8
rcv: 48912.50

What do these numbers mean and how are they related to the transmit
and recieve freqs? There is also a "PL Reed" that I will probably need. What
is this? Motorola wants $90 I DON'T THINK SO!. I'd like to substitute with
something a little less pricey.
Last (and least?) I need a charger for the Ni-CAD. I'd like to build
it myself. Any plans out there?

I live in Columbus Ohio but I travel extensively. I will soon be in
the Detroit Michigan area, anyone up there that can help me? Please respond
via email as my access to news is erratic.

My email address is:
dmarsh@oracle.us.com

So many questions, so few answers.

I am fairly new to Ham Radio and am interested in doing more homebrew projects. The reason I am writing is to ask for info on a good multimeter that doesn't cost a great deal of money. How about RS for one?

I am still waiting for my ticket to caome in the mail (took test 10.5 weeks ago), but to help pass the time and increase my knowledge in Amatuer Radio I have been reading the 1994 Amatuer Radio Handbook, Studying the question pools and getting my code to 13+ wpm to upgrade to Advanced.

Have a couple of General Electric CENTURY 2 radios and need a manual
and programming info.
The radios are modle SE56SSSG5319G3 16 CHAN SYNTHESIZED radios.
Would like to get em up and running.
If you can help please let me know.
THANKS
Graham Warrington

>
these are the crystal freqs in KHz. the xmit crystal is 1/9th the xmit freq.

The recieve crystal freq = (recieve freq - 16.8MHz)/3 The 1st if is 16.8MHz. 2nd is 455KHz.

You'll have to tweak the front end recieve LC circuits some, but don't touch the IFs. And tweak all the xmit LCs. How to tell apart? You should get the service manual. Mine refers to H23ff...., so yours may differ some. You might need to add some tiny caps (both physically and in the pF range) to get the LCs down from 163 to 146.

There is also a "PL Reed" that I will probably need. What
>is this? Motorola wants $90 I DON'T THINK SO!. I'd like to substitute with
>something a little less pricey.
If the reed is "4A", it may be compatable with the local repeaters. or the reed circuits could be removed, but there's some small change to make to the squelch.

As for the NiCads, I wouldn't be suprised that they might be dead now. I mean not chargable anymore.

I've been using an HT220 board or my packet radio, crystaled on 145.07MHz. Coupled with a small power amp stage to generate about 8Watts. It's been going for 5 or more years in this service, and the friend who gave it to me had it this way (different freq's for voice work) ten or more years before. It just keeps on going.... We run it off a power supply, and I'm using a J pole antenna.

I've heard of it on the 74x series of radios, but not the 732. How does one
get it into demo mode without tinkering inside the head unit?

Hi, netters,

Currently, I am looking for a small size motor for my research project. It is for sheep sheering tool. The specifications of the motor are:
1) size : 35 mm in diameter and 100 mm long
2) speed : 2500-3000 rpm
3) output power : 200 w
Any contact of manufacturers or distributors will be appreciated.

Many thanks..

There were a service series published by Sams caled Trasistor Service Manuals
(or TSM's for short)..

There is also a 5 volume set out by sams called Radios of the Baby Boom Era..
or some such set.. basically 8x11 inch format, about 3/4 inch thick each, and
a alphabetic listing of pictures of sets by manufacturer.. The original poster
should check this out in a library, and match up the pictures..

I ordered the 1054 receiver kit last friday, it arrived yesterday.
I had originally intented to get the 10-band receiver kit(1253?) but
the salesman clearly told me that it will be
several weeks before they are ready, and that they could take an order
but would not charge before it shipped...I placed an order, but later
called back and changed it.

So, anyways, they seemed pretty upfront in my dealings with them. Your
mileage may vary..

Here's a different subject...

What specific brands/models of PCs have folks found to be particularly
good or bad with regard to RF hash generated, and suseptability to
RF fields?

I'll start: my Compudyne 38625SXL (Twinhead) notebook is pretty good as far
as generating noise, below 10.15 Mhz. On 20 meters, and up, it's
pretty much of a disaster, growing worse as the frequency increases,
even when run on battery power and equipped with split ferrites on
all external cables. The LCD display seems to be part of the problem.

On the plus side, it tolerates fields which are equal or greater to
what the PK232 can take.

Thank you for advices from Mr. Coffman, Mr. Watts and Mr. Stockton.
I cleaned most of connectors and resoldered those on PC board(s) of
tunning circuit, but unfortunately, it did no good(Unfortunately, all
I have is an analog circuit tester and I lost my maintenance manual).
This morning, I removed the small PC board which has Photo Tr and kept it
under desk lamp and then cover it by my palm. Frequency hopped around
in either cases. Now I am more suspicious about these Photo Tr.

BTW, my TS-430s is really early version and I had to bring it to
service station five times within a year(under warranty) after my
purchase in 1983. Each time, it got new jump wires and parts somewhere.

>I am fairly new to Ham Radio and am interested in doing more homebrew projects.
>The reason I am writing is to ask for info on a good multimeter that doesn't
>cost a great deal of money. How about RS for one?

Most of the inexpensive digital multimeters on the market are OK for hobby use. They're all basically relabeled imports. The knockabout meter I'm using now has the Triplet name on it, but it comes from Korea. I like it because it has one of the biggest LCD readouts I've seen in a meter it's size. Having big numbers is useful for service work where you may not be the ideal distance from the meter when making a reading, because there's no good place to sit it down. It was also only $30, so if I drop and break it, I won't cry. I gave up on the little pen meters because they don't suit the style of work I do. The indicator is always at an angle I can't see when I need to read it.

The more expensive meters are basically giving you a more rugged instrument and perhaps a few more measuring features. I generally don't think the extra cost is justified, unless you're talking about something like a Fluke scopemeter. Radio Shack has some meters in the class of the Triplet I use, but they charge more for them due to the retail channel. You can likely get a better price on a similar instrument from an electrical supply house.

On the other hand, if you want an analog meter, and there are good reasons to have one, then you're going to spend real money to get a good one. The Radio Shack analog meters are basically junk. Spend the money and get a Simpson 260 as a lifetime investment. The reason you may want an analog meter is that the meter dynamic behavior can tell you a lot about a circuit that you might miss with the digital instrument. So, the meter ballistics are important, and the cheap meters don't have good ballistics. Of course if you have a good oscilloscope handy, you likely will use that for most measurements instead.

Paul: the dream rig would be a 6M version of the Uniden HR-2600. That's
what I would like....a simple 25w all mode 6 meter rig... if they can make
them for 10 meters and sell for 259, I am sure they could make the same rig,
with 6 meter guts, all modes, split transceive, etc, for around $300...

I'm sure they would be able to sell one to almost every ham !

You *should* get a count when exposing the phototransistor to a lamp, particularly a fluorescent. On 60 Hz power you'd get a 120 Hz output provided the phototransistor isn't swamped by too much light. That's why they use a DC powered LED as the light source. The light has to be constant, and of the proper intensity for the circuit to work.

This is also a clue. If you've eliminated intermittant connections as a cause, then the light intensity may be such that the phototransistor bias is incorrect. That works two ways. I've seen cases where the illuminators have lost intensity with age. That's uncommon with LEDs, but is common with the little grain of wheat incandescent bulbs used in some optical encoders. I've also seen cases where the bias to the phototransistor has shifted due to component aging in the circuit, IE a resistor has changed value, or due to supply voltage drift. If the bias for the switching threshold becomes marginal from either cause, noise on the supply line can make the circuit switch randomly.

Phototransistors are rarely flaky. They either work or they fail completely. If the circuit counts at all, you should suspect all other causes before blaming the phototransistor.

>It transmits and Receives on 163.5375 MHz. It has a 15 Volt NiCad. It is
> xmit: 18170.8

The transmitter in these uses freq. triplers to get up from the xtal freq. to TX freq. 18170.8 x 3 x 3 = 163537.2. Mine is a 462 MHz unit that has one more tripler to get up there.

> rcv: 48912.50

Let's see... receive xtal = (Tx freq - IF freq) / n; where n = 3,9,27 etc. Using n=3 we get an IF of 16.8 MHz, which sounds reasonable. International Crystal Mfg. has crystals for these radios - call them at 405 236 3741 and tell them what you have. You may need model number and "chassis number" which is a number like NUE6001BA that you can find inside the battery compartment. The xtals are a bit pricey - $15 to $25 each, but what the heck, I only paid $10 for the radio at a flea. You will need to re-tune the tuned circuits in the radio, and for this you will need the Motorola manual... try Motorola or a local service shop for that. I copied the 450-488 MHz radio manual that another ham here had around. Make sure whoever knows you are re-tuning to a ham band, or else they'll want to know your commercial license #!

By the way, I have a line on cheaper crystals from a different source, still waiting for someone to get back to me on that.

>There is also a "PL Reed" that I will probably need.

This is pre-microprocessor coded squelch technology. A tiny mechanical reed functions similar to a quartz crystal, except at audio freqs. If you're going to use the HT to get into a repeater with PL tone access you need it, otherwise you don't, like for simplex. Mine came with one, but you could always add one of those tiny PL decode/encode boards from the back of QST.

> Last (and least?) I need a charger for the Ni-CAD.

Yah, these radios typically are placed in a "drop-in charger" which does the job. I'm not sure how I'm going to handle this myself... The battery that came in mine was good, though, and charged up to 15V no problem. Pick up a spare at a flea, as Moto wants something like $75 for them.

> Doug N8TUT

Good luck with the mods! I'll be doing mine as soon as I find out about those cheap xtals! Makes an interesting project...

SAM's made a series of repair manual for portable transistor radios. The TSM series of manuals covers the years 1963-1975 in volumes 24-159. I have no idea why there's no volumes 1-23, there just aren't.

I have volumes 24-110, missing 66, which covers years 1963-1970. If you are into transistor radio restoration I'll make you a deal on the lot. If interested let me know.

1907. HF starter rig recommendations (was Re: Bizarre QST Statement)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-26 19:13:30 UTC
From: vinod@watson.ibm.com
Message-ID: <2s2scq$17a8@watnews1.watson.ibm.com>
Source record: 226637
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

This seemed like an opportune moment for a post I have been wanting
to make for sometime.

I read the QST article with much interest, as I am going
to be looking for a used HF rig in a couple of months or so. I am
waiting for my no-code ticket, and am studying code right now. I
was thinking of getting a tranceiver to listen to W1AW code practice,
but instead got a ten-tec single band kit, which I am goint to build
this weekend, thus postponing the tranceiver purchase until after
I have my novice ticket.

So, please send me your advice on what I should look for in a used
HF rig. I expect to be able to spend around $400-$450 max, for the
rig, tuner, and power supply. So:

- What models would fit the above criteria?
- What features should I look for?
- What should I avoid?
- Can I get something which is all solid-state for the above price
range?

I am cross posting this to rec.radio.amateur.equipment as that
is probably a more appropriate group for followups. Also, please
feel to email directly to me, and I will summarize to the net.

Many thanks in advance.

I'm a fairly newly licensed person and would like to get some pros/cons on some HF rigs, specificlly the FT-890 and TS-450. Both rigs are in my price range and seem to offer the features that I desire. My main interest lies with CW so I know I'll want the 500khz filter in which ever one I choose.

Instead of lecturing me on brands, I'd like to hear about specific points of each radio. I seem to remember reading this newsgroup a few months back and saw some discussion on the TS-580 vs the FT-990. I would like somehting along that same thread.

Here are some of my general observations:
FT-890
Likes: Analog meter, size, audio sound, layout of the knobs/controls
Dislikes: No numeric (ie keypad entry),

TS-450
Likes: Keypad entry, seems to geared towards a higher end user (can grow into the radio), wide array of filter options.
Dislikes: Digital/bar meter, controls maybe to small for my club fists, display maybe hard to read with my poor vision except under optimal conditions.

I'm looking for you'all to give the technical guidance that new hams look to older/more experienced hams for.

Troy Flowers KE6ASO

I picked up a TS-440 with no filters. Another ham in the area has the
TS-440 with both of Kenwoods 500 and 250 Hz filters (another CW fanatic).
I just about picked up both but instead started looking at the specs on
the International Radio filters. They have steeper skirts than the
Kenwood and so I decided to try the 400 Hz first. It did not drop in but
works much better than expected. My old FT-101 500 Hz filter let too much
through the sides. This one works well.

1915. Yay-hoo FT-530 : Piece of junk

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-27 02:17:01 UTC
From: randyr@tyrell.net
Message-ID: <DeKvj4xQ5aGN055yn@tyrell.net>
Source record: 226566

Last Saturday at a local hamfest, I plunked down $516 bucks on a FT-530. I was impressed with this radio... until this afternoon.

After a 10 minute conversation on 440 with no problems at all, I needed the rig to call a friend of mine. When I turned it on, the UHF display was blinking. I have tried everything to get it to stop. Now, both VHF and UHF are blinking. Since last Saturday, this radio has been used less than 10 hours total.

I have pulled both batteries out, tried to do both cold and warm starts - nothing at all will bring this thing back!

When I returned the rig to the store, all the folks there tried to get it back. When the head honcho called Yaesu, I was not impressed - and I don't think he was either .... apparently Yaesu knows this problem exists. I overheard the conversation - the owner of the store said, and I quote, "Yes - we have a bunch of them in the back.... You mean the others are probably bad also? Oh, wonderful!"

The store let me exchange it for a IC-W21AT, after I told them I was really afraid to get another FT-530.

Anyone thinking about one of these rigs should definatly consider something else.

I realize that there are other folks who have these rigs and have no trouble. But I have had trouble, and after hearing this phone conversation, others will also.

: So, please send me your advice on what I should look for in a used
: HF rig. I expect to be able to spend around $400-$450 max, for the
: rig, tuner, and power supply. So:

I'm not sure of prices in your part of the world

: - What models would fit the above criteria?

More a case of which radios are still worth having despite age or problems sufficient to drop them into that price range. This means either very old, very undesirable or faulty. Some radios do well in old age, some radios considered undesirable by almost everyone are actually good, and I've come across a few faulty examples of desirable radios at very low prices. You do have a chance of success.

You depend on luck for something worthwhile to be available in your area when you look. You'll probably need some experienced help as a cheap radio is likely either to have some faults or else to be unreliable through age. This is inevitable, but you'll learn a lot.

: - What features should I look for?

Most advertised "features" are trivia. You can have plenty of fun with a very plain radio.
Decide what bands you need (many older radios miss the 3 new "WARC" bands). You should look for something in reasonable condition, or that could easily be put into reasonable condition. Treat this radio as a learning exercise, it is probably only the first of several you will own, don't try to do or get everything at once.

: - What should I avoid?

I agree with the "Bizarre" advice. If your radio has to have valve (tube) outputs, go for something with 6146's rather than TV valves. Both work, but the 6146's are much more tolerant of you learning how to tune up. With a few exceptions, the 6146 radios are a bit newer, and might be in better condition as a result. Early FT101 models used TV tubes and took some skill in setting them up after new tubes were fitted, FT101Z and FT101ZD bear little relationship to the other 101's, they use 6146. The FT901 was a 6146 radio and was the real parent of the FT101Z and 'ZD
The old Drakes have really nice receivers, but you do need to be quick when tuning their transmitters. The Trio/Kenwood TS530 and TS830 competed with the FT101ZD and FT901 and are worthwhile.

These radios can kill inexperienced, or incautious people trying to repair them. Nowadays most people are not used to handling high voltages.

: - Can I get something which is all solid-state for the above price
: range?

Perhaps. The TS120 TS130 are fairly plain, but work OK. You could save some money by using a car battery and a charger as a power source. I'm not a fan of the TS430 as they do seem to be fairly unreliable, and the TX output is not as clean as I'm prepared to use on the air. The FT757 has a poor receiver which is easily overloaded. An old FT707 is another possibility, a bit small, packed and fiddly to work on. I rather like the FT107, a radio that never really caught on, but quite decent, it deserved far greater popularity. The older ICOMs are a mixed bunch, there seemed to be a period of them made with lots of dry solder joints, followed by a period of radios blighted by the fears of data loss killing the radio when a battery dies. I don't know exactly which radios are at risk. Later ICOMS are very desirable indeed, if you find a faulty/damaged IC735 it could be well worth repairing I rate these as performing comparably to many of the current top price band radios.

If you take the buy-a-dead-one-to-fix route, I should point out that Ten-Tec have a fabulous reputation for parts availability and helpfulness. Their radios are the easiest to work on and cheap to repair. If I had to get myself a really good radio as first priority, and then wanted to minimise the cost, I'd go looking for a faulty CorsairII and get my soldering iron warming.

: I am cross posting this to rec.radio.amateur.equipment as that
: is probably a more appropriate group for followups. Also, please
: feel to email directly to me, and I will summarize to the net.

It is the right place. I wish people would try the most suitable group first, and then try others if the result was unsatisfactory. Crossposting spoils the purpose of having the separate groups. Sorry, just a pet niggle...

Hope I've been able to help a bit, strictly my own opinions,

David GM4ZNX

Don't overlook the possibility of using your shortwave receiver to listen to W1AW. Even an inexpensive portable should bring it in loud and clear on one frequency or another (as long as it has USB/CW capability).

On the 741 (I think that's what I have), pressing CALL during the power-up self-test period puts it into demo mode. I think this is a major nuisance, and a MIS-feature! So try that (or check the manual first, to see what to expect.)

I've got a DR-600 as well, and I've experienced the same problem with the
remote control functions. If (and when) you get the big-fix done, could you
post information on it here?

Personally, I love the rig - works beautifully, all the power levels etc were
actually a watt or two higher than spec, but then I'd certainly not complain
about that!

De: Greg KN4EL
I bought last Summer, an SDP600 simplex/duplex autopatch
from J.com. I used the unit for 3 weeks while on vacation and have
no use for it. I would like to exchange it along with an Icom
2at (NOT 02at) thumbwheel/ttp handhelt 2m radio for a handheld scanner
preferrably bearcat 2500xlth or $300 cash for both. Would exchange
patch alone for bearcat 200xlth. (Prefer both with cell phone mods)

Please reply here if interested or to my email add.

Tnx and 73

1929. Frequency Counter Recommendation?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-28 13:56:51 UTC
From: jerry@hnrc.tufts.edu
Message-ID: <1994May28.085651.2399@hnrc.tufts.edu>
Source record: 226563

Would anyone care to make a lower-cost frequency counter recommendation?
The more affordable models seem to be

Radio Shack 22-305 $100
OptoElectronics 3300 $130
Startek 1350 $130 list

I notice the OE has a hold button while the RS doesn't. Not sure about the Startek. My intuition tells me this could be worth the extra $'s. Any comments?

Thanks.

(story of blinking display and failure deleted)

1) Wow, $516? Did the price just jump? Is this the
result of the lousy exchange rate?

2) Do you remember your serial number? Specifically, the two
numerical digits immediately following the alphabetic letter.
This identifies the lot number.

I am curious as to whether Yaesu changed the CPU programming
to comply with the STUPID ECPA rules and "broke" the microcode.

A flashing display used to indicate that the PLL is unlocked.

Just curious.

Although mine has it's quirks, overall it has been just fine, and I wouldn't
hesitate to recommend it to others. Great feature set, great performance.
Although it is not immune to intermod (like all dual-banders), it usually
only succumbs in the really hairy areas in close proximity to overblown
paging transmitters. All in all, a nice HT. I'm sorry Randy had a bad
experience.

From: ew032@cleveland.Freenet.Edu
Message-ID: <2s9ena$omk@usenet.INS.CWRU.Edu>
Source record: 226558

I have had my W21AT for about 3 months...and I LOVE it...it's agreat radio...and there IS a SIMPLE (no hardware) MOD to increasing the band coverage to 50mhz-999.99mhz ... and there *IS* a think called RepeaterPower or something like that...I use it QUITE often...keep it on almost all of the time.. hit <F>-8 and look for something that says: rP in the lower right hand corner, then turn it on... when you go back into the mode, you should see blinking LOW power indicators.. every 1/10 of a second (or something) it's measuring the power it takes to receive from the repeater, and it only USES that much power in return. It's quite a handy feature..
if you need any help about the W21AT,
you can mail me..: stmille@ctp.org

1938. Yeasu 767 transmit problem

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-29 07:45:06 UTC
From: Larry Jenkins KN6WI <Larry.Jenkins@CL_2743.chinalake.navy.mil>
Message-ID: <CqK077.FLC@avalon.chinalake.navy.mil>
Source record: 226572

I have a Yeasu 767GX about 6 years old. It has recently taken on a new trick. When I tune up using the MOX button in CW mode, It takes close to a minute to come up to power. Even when the SWR meter reads 1.5 or less. I tried it into a dummy load and get similar results although it seems not quite as bad. I think the slow power up is affecting SSB also. I can barely get thru many times.
Any ideas on the cause???

1939. Yaesu FT-530 Question

Source record: 226569

Scott,

He had the guts to get on the net and say he paid $519 for an FT-530
from a dealer. Then his rig quit working and he got all geeked out and
returned it for a Icom Wxyz dual-bander, instead of getting another 530.

I suggested that he may not have a callsign (or is a tech-lite) and got
ripped off by the dealer as dealers can smell a new ham with cash for
miles!

I'm looking for schematics for an HP 1220A Oscilliscope.

Any other pointers would also be much appreciated. Does HP run an ftp site? Can anyone provide me a snail (or email) address for the appropriate division at HP?

My poor scope was set for 110V when I plugged it into 220V :-(. I'd like to find out what these little components were BEFORE they blew up... It might even be nice to know what other bits and pieces may have fried themselves more quietly.

Email replies are prefered. I'll summarize to sci.electronics if there is interest.

For sale: Tempo FMH-2 HT2Mtranceiver.140-165 MHZ.Rf output
low-1W,high 2W, with key-pad,battery life indicator.Crystal
controled with several extra crystals.Matching battery charger,
manuals for both.The unit is in excelent working order,
just put battery in it and you are on air,batteris are AA.
Price is dirt cheap,$ 30.00 plus postage.
Alfred.

1951. Kenwood TH-78A

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-30 21:35:56 UTC
From: billd@engr.sgi.com
Message-ID: <2sdm7s$4qq@fido.asd.sgi.com>
Source record: 226579

I've been wanting to upgrade my Alinco DJ-560 dual bander for quite a while now and have been holding out for a new release from Alinco with an alphanumeric display. But, during a routine stop by the local ham radio store, I couldn't help but pass by the HT display and see that the Kenwood TH78A was on sale ($400). I stupidly asked the salesman if I could look at it and saw that despite a user interface as bad as Icoms, it had most of the features I was looking for (alpha display, expanded receive, 125 alpha memories with the $35 ME-1 module). So, I took one home.

It's been almost a week now, and I have mixed feelings about the radio. The mod was easy (didn't even have to pull the brass shield like the mod instructions suggest). It now supposedly receives from 50-180, and 300-512MHZ. I hoped it would also receive from 800-1000MHZ, but apparently all the newer TH-78As (ser #s starting with 510 and later) have this band locked out. Too bad, but no big deal since I have a scanner that covers that range anyway.

While the receiver seems adequately sensitive in the amateur bands, one thing I immediately noticed about the unit was that if you tune in anything a significant distance away from the ham bands, the receiver sensitivity drops substantially -- much more so than on my Alinco DJ-560. For instance, I tried to listen to some public service frequencies in the 470-490MHZ range, and discovered that the radio was almost completely deaf this far away from the ham bands. Only when I connected the HT to an external antenna was I able to hear any transmissions, and then only from nearby localities. In contrast, the DJ-560 was able to receive these same transmissions and more with only a rubber-duckie antenna. Interestingly enough, the TH-78A receiver sensitivity seemed to drop a lot more for frequencies above 450MHZ than for frequencies below 430MHZ.

The Kenwood has a nice feature that allows either receiver on it to be operated on either the 2M or 440 band. I noticed (as others have pointed out) that the 2M receiver was more sensitive in the 480-490MHZ range, for instance, than the 440 receiver. This seemed strange to me. Still, the sensitivity was much worse than the DJ-560 receiver.

I travelled back to the ham radio store and played with their display unit for a while to verify that there wasn't something wrong with my TH-78A and discovered similarly poor receiver performance.

Disappointed, I started looking through the schematics for the unit and discovered a number of high- and low-pass filters between the BNC antenna connector and the VHF and UHF transmitter and receiver modules. Since these filters are shared by both the transmit and

receive modules on each band, it's probably likely that they have 50 ohms input and output impedance. With this knowledge in hand, it ought to be fairly simple to calculate new values for the filters to provide higher cutoff frequencies, especially on the UHF side. However, I'll probably leave experiments of that kind to someone with access to decent test equipment unlike myself. In the meantime, I'll just have to tote around the scanner with me to listen to public service frequencies.

The only other thing I've noticed about the unit so far that I don't care for is the fact that in order to access a number of the features on the HT, you have to hold down buttons on the keyboard and turn the unit on. This in itself isn't so bad, but I often have to use a blunt pointed object to press the button down hard enough to be able to get the unit to respond when I turn it on. I don't understand this since the keyboard responds to much lighter touches during normal use. Anyone else noticed this problem?

Aside from the above, I like the unit. The sliding panel over the keyboard is great, the backlighting is the best I've seen, and with 125 alphanumeric memories, I don't ever have to be stingy with memory. If you can live without an alphanumeric display, the FT-530 might be a better choice, but I'm hooked, so I'll stick with my TH-78A.

>
> Thanks.

Once again, it looks like its going to end up costing twice what I originally thought. I've been told that what I really want is automatic capture. Since I've yet to be disappointed by anything I've purchased after receive a range of opinions on the net, I'm very curious to hear any arguments for or against the OptoElectrics M1, Startek ATH-10, or Startek ATH-15. My primary use will be mobile, to determine what frequencies those around me are transmitting on.

Thanks much.

1954. EICO 369 ?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-30 22:32:26 UTC
From: schumann@crl.com
Message-ID: <2sdphq$sci@crl.crl.com>
Source record: 226581

Greetings,

A friend of mine dropped off a piece of equipment that I believe is a
signal generator. Here's the description:

EICO 369
8.5"H x 13"W x 7"D
2 large dials:
On Left: "Marker 2-225MC"
On Right:"RF 3-220MC"
6 smaller dials, below the large ones.
Below the dials:
XTAL (this is in the 10.xx M range)
SCOPE (to scope)
DEMOD IN
RF OUT
Further:
Brushed aluminum front framed in dark gray metal frame,
the rest of the box is light gray. All metal.
This is a 117VAC device.

This may or may not be the correct area to post this question, but the
rec.radio areas are what I read.

TNX

This is twice now--here and in the original post. I believe the proper designation is Technician (or Tech or no-code Tech). Because the net is a public forum, it is inappropriate to refer to a class of individuals by a term that some might view as derogatory. Also, it's not at all clear why *any* new hobbyist couldn't be a victim to this sort of scam (if it was a scam; for all we know he could have bought a quick charger, too). :-)

P.S. If I had to bet, I, too, would guess that he was overcharged, but why jump to the conclusion before all the facts are in? :-)

1956. 1939 Philco Mystery Control Box

>I'm a fairly newly licensed person and would like to get some pros/cons on
>some HF rigs, specificlly the FT-890 and TS-450. Both rigs are in my price range and

I have the 850AT, with the optional SSB filter (which I use 85% of
the time) and I borrowed a friend's FT-890 for a couple of weeks for
side by side comparison, with a Daiwa switch in reverse for nearly
instantaneous switching between the rigs.

The 850AT is faster to operate, has a nice quick memo feature, etc.,
but on VOICE, the Yeasu, especially on the low bands, was much more
pleasant to listen to. The Kenwood requires you to constantly play
with the RF gain control to separate the voice from the static
noise. I didn't listen to enough CW to tell you how these rigs
differ.

A friend did the same test but with a 440AT (which does not AT tune
160 m btw) and has the same impression.

From: mangefeste@ACM.ORG
Message-ID: <2sefs8$73n@hopper.acm.org>
Source record: 226587

Ok, all you hams out there.
I am in the market for a dual-band mobile unit. All I have now
is an EXCELLENT FT-530, and I am looking from something a bit more
on the wattage side.

Except one problem, I want to continue to buy YEASU, but I like the Kenwood's
removable faceplate.

Therefore for those who might have one of the two, or know of some info I
don't please respond.

The first question is this:
Althogh the 5200 was a removable faceplate, is it still attached via
cable to the main unit? If so, is it easy to remove, I mean
is the plug made for fast and east detachment if at all.

The second question is this:
With Kenwood's removable faceplate, is there any loss in performance?
Because of that is the Kenwood built like the 5200? Is it as rugid?

Like I said, I hope to have an answer before I proceed to HAM-Com and
hopefully find a good deal. Any opinion, and/or story about why you think
one of the two above rigs is better would be appreciated.

In the immortal words of "Al, the assistant" -- "I don't think so, Tim."
Sounds like a dealer with a very low discount. I was at the Maryland FM
Assoc.'s HAMfest this Memorial Day weekend and several of the dealers had
530's for $420 and $416! Yes, I had to look twice too because that's what
I bought mine for at EEB over a year ago.

Gotta say that Randy's overreacting a tad. So it's a bad batch -- it
doesn't mean that every FT-530 in the universe is junk. Go to another
dealer if you can as he's unlikely to have ones from the same batch.

1973. Shortwave Receiver Recommendations

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-31 17:18:00 UTC
From: BARTSCH@A1.RCDP.GOV
Message-ID: <01HCZKDD7WN89VUS24@BONNIE.RCDP.GOV>
Source record: 226496

I have a friend (non-ham) who would like to buy a nice desktop shortwave receiver for $500.00 or less (preferably new).

I've been out of the world of SWL for many years now and cannot give him a competent recommendation. If you're familiar with the current market of shortwave receivers I would like to hear from you. He'll be listening primarily to the AM broadcast bands and wants the capability of picking good DX out of the crowd.

Thanks!

Eric Bartsch - N0JVP

Hi All

I'm looking for a handheld transceiver (dual band). Right
now I'm considering the FT530 (Yaesu), the DJ580 (ALINCO) or
the TH78 (kenwood).

maybe someone can point out the differences between tem, or share
some experiences with one of these rigs.....

Please E-mail...

>apparently all the newer TH-78As (ser #s starting with 510 and later)
>have this band locked out. Too bad, but no big deal since I have a
>scanner that covers that range anyway.

Bill, you probobly only completed half of the mod. Check the modfile for
the SMD diodes to remove for xtended operations. I don't think that
you can get at these with the shield in place.

>The Kenwood has a nice feature that allows either receiver on it to
>be operated on either the 2M or 440 band. I noticed (as others have
>pointed out) that the 2M receiver was more sensitive in the 480-490MHZ
>range, for instance, than the 440 receiver. This seemed strange to
>me. Still, the sensitivity was much worse than the DJ-560 receiver.

There is a rx sensitivity report in one of the mod files. you may find
them interesting. Also, dont bother comparing the 78 to the Alinco,
the 78 has much more to offer and isn't a scanner.... but will do a faiur
job on out of band rx. stick with the scanner for vhf dx.

>The only other thing I've noticed about the unit so far that I don't
>care for is the fact that in order to access a number of the features
>on the HT, you have to hold down buttons on the keyboard and turn the
>unit on. This in itself isn't so bad, but I often have to use a blunt
>pointed object to press the button down hard enough to be able to get
>the unit to respond when I turn it on. I don't understand this since
>the keyboard responds to much lighter touches during normal use.
>Anyone else noticed this problem?

Try holding the power switch down a bit longer when trying these features,
it takes a bit to recognize the keypad combo. No poiunty objects needed.

I have put the 78 through a load of torture, including packet and VHF/UHF
contesting and it still amazes me. I have found the time needed to get
on line with the programming very worthwhile and have compared the 78
with the DJ580 and the Yaesu, the 78 kicked their butts!

So, before i tee off on the yaesu again,.....

73 and enjoy yer 78

Hello. My friend recently purchase Kenwood TH78A and wants to modify it(extended coverage and 800MHz). Unfortunately, he has to go to another country and I do not have enough time to find Modification Book for it. If anyone has it, would you kindly E-Mail the mods to my address, I would REALLY appreciate it.
Also, I've heard that latest models of TH78A are blocked to 800 MHz band. Is it true?

I am considering the purchase of a TS-850S and was wondering if anyone out there has used Ham Windows from Kenwood, or any other software with the TS-850S, or any other Kenwood radio.

I have a spare 386 lying around that might be very useful interfaced to a TS-850S.

Any info would be appreciated.

> sensitive counter.
> Mike

Well, according to Optoelectronics' "20th Anniversary" catalog, the
cheaper Model 3300 is more sensitive than the Model M1 in some ranges.
It surprised me too, but here is what they print:

Input Sensitivity (Typical)

Model 3300	Model M1 (50 Ohm input)
10MHz	<15mV	<5mV
27MHz	<300uV	-
150MHz	<300uV	<500uV
450MHz	<350uV	-
800MHz	<3mV	<3mV
1GHZ	<3mV	<10mV
2GHz	<25mV	-
2.4GHz	<40mV	<50mV

Of course, what they advertise and what the things can do may be two
different things. I just ordered a 3300 this morning, so we'll see..

I was surprised to find that the counters come with *no* antenna.
Also, shipping is a bit out of proportion. The salesperson originally
said $15 for UPS 3-Day, but I eventually got $6 UPS ground (I'm in no
hurry). On something the size of a deck of cards, this seems a bit
steep. I've shipped breadmaker machines UPS ground for $3.50...

From: hoagy@illuminati.io.com
Message-ID: <2sh8pk$87e@illuminati.io.com>
Source record: 226505

All of them are superb radios.

The Yaesu FT-530 has the *most* "bells and whistles".
That is, it has the most features and can be quite complex
and overwhelming.

The DJ-580 and TH-78 are also excellent radios, but less techie.
However, I personally believe the TH-78 looks the neatest
out of the bunch.

I prefer the Yaesu and Kenwood over the Alinco, due to the fact
that with all Alinco products I've seen(HT concerned), the
dials/knobs are a bit flimsy, and look like they're about to
pop off at any second.

All of them are priced almost the same, around $400 U.S. dollars,
give or take $20.

I made DX contact from my mobile station on 11m and 10m bands over in France.

I want to buy a new transceiver for that, but I'm not sure of the model...

Is there someone can discuss about 2 models of transceiver :

- the UNIDEN 2830 (President LINCOLN in Europe)
- the RANGER RCI-2950 (Dirland RCI 2950 in Europe)

WHAT THE BEST OF THIS TWO MODELS ?

In RX, in TX, in quality of modulation and fabrication ... etc

Thanks for all responses,

Best 73+51 to you aand QRA.

A too sensitive counter is a pain in the butt to use on the bench.
It wants to lock on all the local broadcast stations and paging
transmitters instead of the radio you are servicing. A counter
with 500 mV sensitivity is plenty sensitive enough to read LO
frequencies. Many of these "sensitive" counters are in plastic
cases so you can't even put a step attenuator on them to tame
their wild counting. The last thing you want on a counter is an
antenna. That just makes stray signal pickup worse.

I did sensitivity tests on my Opto 2810 counter. Here they are.......

I don't have regular access to special equipment but one day when I had
a few spare moments, I spec'd out my Opto 2810 frequency counter's
sensitivity over various frequencies. I used a Marconi 2022D signal
Generator which outputs from 10KHz to 1GHz and a few feet of an
extremely low loss Andrew cable. All readings were taken when a solid
lock on the frequency occured. Using other instruments, I was able to
get the unit to lock on a signal as low as 5 Hertz and as high as
3.5Ghz. The high end required great amounts of power and I didn't want
to blow the front end so I didn't try and take it above 3.5GHz. The
measurements that follow are over the Marconi's frequency range.

Input B: (10Hz to 50MHz input)

Frequency db

10KHz 1.5mv
100KHz 1.5mv
250KHz 1.6mv
500KHz 1.7mv
750KHz 1.8mv
1Mhz 1.9mv
5MHz 2.2mv
10MHz 2.2mv
25MHz 2.5mv
40MHz 3.2mv

50MHz 3.6mv
60MHz 4.4mv
70MHz 5.0mv
75MHz 5.5mv

Input A: (Amplified 1MHz to 3GHz input)

Frequency db

1.75MHz 24mv
2MHz 17mv
3MHz 2.9mv
4MHz 1.5mv
5MHz 800uv
10MHz 230uv
20MHz 110uv
30MHz 80uv
40MHz 75uv

1993. External Power Plug for Kenwood 22AT????

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-01 14:40:19 UTC
From: mmurray@leroy.cc.uregina.ca
Message-ID: <1994Jun01.144019.135348@sue.cc.uregina.ca>
Source record: 226529

Does anyone know the size specifications for the external power plug for the Kenwood 22AT? Is it a unique plug to Kenwood? The common plugs available are 1.3mm and 1.5mm pin diameter with 2.5mm external diameter. These plugs are not tapered near the tip like the Kenwood plug. Anyone had any luck using 3rd party plugs?

Thanks in advance

Mike Murray

From: tah@uclink.berkeley.edu
Message-ID: <2si92h$2qd@agate.berkeley.edu>
Source record: 226513

I am trying to start a community FM station in rural Vermont on
very limited funds, without getting whacked with a $10K FCC fine
for pirating... so, instead of a Ramsey FM-10 and a homebrew amp
I'd like to find a used and approved FM transmitter or exciter.

I am trying to cover about seven miles directionally (I'll worry about
the antenna design later), so I figure that something in the 50Watt
range might be plenty.

If you have any idea where I could find such a thing, for fairly cheap
(I was told that the FCC will approve your homebrew setup for $5K, but I'd
like to invest no more than a few hundreed dollars) please send me e-mail.

Thanks,
Andy

>You can put your nose back into that catalog now.

Hey, take it easy! I don't bad-mouthing tech licensees - I AM one.
I got my tech license back in October, so I know how it feels to
be the new guy on the block. As to your other points, I did indeed
support my local dealer by purchasing my FT-530 there. They are no
super-bargain chain, but it still only cost a bit over $400 during
Yaesu's holiday sales. All it took was a glance through the magazines,
perhaps a phone call or two to the other dealers, to find out what the
going price was. I'm sure if Randy had asked for information here
(as many often do) before purchasing, he would have received many
helpful responses. It doesn't take a Ham radio expert to avoid
over-paying. The same rules that apply to shopping for anything in
life apply here.

No flame intended to anyone during any of this. I'm sorry if anyone
took it that way. I hope Randy gets his situation resolved to his
satisfaction. I love my 530 despite it's quirks, and I'm sorry to
see someone else have a bad experience with one.

I need the service manual for the Kenwood TM-421A 440MHz Xcvr.
The distributor for Kenwood says it is no longer available.
I will gladly re-imburse for a GOOD copy, or give a fair price for
an original. If you can let me borrow one to copy myself, that works too.

Tks,
Dick

Fox-Tango is now International Radio, of (I believe) Ft. Peters, Florida. Somewhere in Florida anyway. They still sell a complete line of (IMHO) excellent IF filters for Kenwood, Icom, Yaesu, et al. They also have mods information and books. You can also buy new equipment from them, which they can install their filters in and optimize (for a nominal fee of course). Good outfit to deal with. Sorry, don't have the #, but if you look in QST or CQ, you should be able to find one of their ads. Good luck.

Hi,
I'm looking for a 2meter or dual band (144/440) mobile rig.
It must have at least 40 watts on 2m and 25 watts on 440 if
it's a dual bander.

Brand doesn't matter, but it must be in working condition
and have a mic with a DTMF pad.

Please post information and asking price. Thanks!

brunelli_pc@delphi.com wrote:
: Bill Dorsey <billd@engr.sgi.com> writes:
:
: >It's been almost a week now, and I have mixed feelings about the radio.
: >The mod was easy (didn't even have to pull the brass shield like the
: >mod instructions suggest). It now supposedly receives from 50-180,
: >and 300-512MHZ. I hoped it would also receive from 800-1000MHZ, but
: >apparently all the newer TH-78As (ser #s starting with 510 and later)
: >have this band locked out. Too bad, but no big deal since I have a
: >scanner that covers that range anyway.
:
: Bill, you probobly only completed half of the mod. Check the modfile for
: the SMD diodes to remove for xtended operations. I don't think that
: you can get at these with the shield in place.
:
I used volume 5A of the Artsci book as well as the newest edition of the
modfile I could find on the net as reference. The mod involved cutting a
wire and removing a surface mount diode. Both of these were accomplished
without removing any brass shield. Perhaps Kenwood redesigned the shield
so it no longer covers the diodes on later units. The serial number on
my radio starts with 601.

: >The Kenwood has a nice feature that allows either receiver on it to
: >be operated on either the 2M or 440 band. I noticed (as others have
: >pointed out) that the 2M receiver was more sensitive in the 480-490MHZ
: >range, for instance, than the 440 receiver. This seemed strange to
: >me. Still, the sensitivity was much worse than the DJ-560 receiver.
:
: There is a rx sensitivity report in one of the mod files. you may find
: them interesting. Also, dont bother comparing the 78 to the Alinco,
: the 78 has much more to offer and isn't a scanner.... but will do a faiur
: job on out of band rx. stick with the scanner for vhf dx.
:
The purpose for my comparison between the TH78A and DJ560 was not to
suggest that the 560 is a better radio, but rather to point out that
the DJ560 has better out of band sensitivity than the TH78A -- something
that I for one value.

I'm well aware that the TH78A isn't a scanner, but with it's large memory
capacity and alphanumeric display, it is very handy to program in a few
local public service frequencies into the unit for the not too infrequent
times when you're carrying the HT around and something is going on
(accident, fire, invasion, etc.). If only the filters weren't so
restrictive.

: >The only other thing I've noticed about the unit so far that I don't
: >care for is the fact that in order to access a number of the features
: >on the HT, you have to hold down buttons on the keyboard and turn the
: >unit on. This in itself isn't so bad, but I often have to use a blunt
: >pointed object to press the button down hard enough to be able to get
: >the unit to respond when I turn it on. I don't understand this since
: >the keyboard responds to much lighter touches during normal use.
: >Anyone else noticed this problem?
:
: Try holding the power switch down a bit longer when trying these features,
: it takes a bit to recognize the keypad combo. No poiunty objects needed.
:
Indeed, this was the problem. Thank you for pointing it out.

: I have put the 78 through a load of torture, including packet and VHF/UHF
: contesting and it still amazes me. I have found the time needed to get
: on line with the programming very worthwhile and have compared the 78
: with the DJ580 and the Yaesu, the 78 kicked their butts!
:
I suppose it all depends on what you're looking for in a radio. For what
I want in a dual-bander, I think the TH78A is a good choice. I'm certain
the Yaesu and Alinco dual-banders are excellent radios with different
feature sets than the Kenwood, though.

If you call Ten-Tec direct at 615-453-7172 they will send you a 20 page kit catalog. The variety of kits range from SWR meter to QRP rigs and a full blown 2 meter FM transceiver.

I would strongly suggest that you inquire about a delivery date for the specific kit that you are ordering before you order. I called in a order about 7 weeks ago and I've called back twice to check on it since, and they claim that "these kits are still being packed". It appears that they were a little over zealous with the ad campaign before the kits were actually in production. I'm being patient for now because people have been telling me that their stuff is top notch... I'll have to wait to form my own opinion about that if I ever get my stuff...

2009. Kenwood Computer Control

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-02 13:54:00 UTC
From: 0005512847@mcimail.COM
Message-ID: <84940602135448.0005512847NA3EM@mcimail.com>
Source record: 226531

Hello,
I have been searching for the IDEAL computer control software for a while. I have some basic requirements:

1) Handle DX Spots from the cluster (qsy the rig and enter into log)
2) Automatically update log with name/address info from CD or Disk based Ham Database (Buckmaster, Sam, etc)

I have used HyperLog, Ham Windows, LogView, LogWin and some others

HyperLog: The best overall BUT a DOS only program. I work in the windows world so the lack of cut and paste and integrated mouse functionality leave it a bit lacking. Also, since I use a high res monitor I loose screen real estate and font control. But by far the best overall. I also like the fact that you can control multimode TNC's with the program - they are alone in this feature.

Ham Windows: The most features but expensive. Has a cool CIA world almanac built in. The program is a bit buggy and is very gui'y. This slows it down quite a bit. Memory will also suffer - Runs very slow on a 486 w/ 16MB of memory. The program author suggests at least 8 MB. Has a really cool SWL database that can be used to QSY the radio, a nifty feature. This program is written in ToolBook - a high level programming language that really slows things down. They are planning a 'C' compiled version at some time in the future.

LogView: This is now marketed by AEA. This is the best windows entry of all. Very simple to use and set up. For contesting and DX work under windows I would reccomend it highly. Doesn't need alot of system resources.

Bottom line - DOS - go with HyperLog; Windows - go with the AEA product; Impressive array of features but system resource hoggy - go with Ham Windows.

Open for questions.

I eyeballed their kits a Dayton. The 2 meter transceiver in particular
was nicely done. It appears to be a far step above the Ramsey for not
too much more money. We won't know how good/bad it is, however, until
some get into the field and we can find out the quality of the kit materials
and manuals, and put one on a spectrum analyzer.

The other kits also look fairly good, but not spectacularly better than
other kits on the market. They aren't Heathkits by any stretch. You will
have to expect to know and do a lot more to get them nicely packaged and
running than you would with a Heathkit. But then, Heath is gone.

2011. Frequency counters (update)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-02 14:59:49 UTC
From: jerry@hnrc.tufts.edu
Message-ID: <1994Jun2.095949.2428@hnrc.tufts.edu>
Source record: 226447
Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment

I'm farther along in my search for a frequency counter, but not exactly where I'd like to be. All things being equal, I'd go with the Opto M1, even though at $260 with antenna and postage it's about twice what I'd like to get away with. But all things aren't equal. if a Startek ATH-10 would truly meet my needs, I could get off for about $170 while an ATH 15 would set me back $210. (15 = 10 + low battery indicator + 1200 to 1500 MHz + signal strength bar graph)

According to Grove, the person who started Startek was originally with Opto and, in the opinion of the person with whom I spoke, the units use comparable technology.

The only substantive responses came from two very satisfied Opto owners. I'm still waiting for hear from a Startek owner. The comments follow.

Are there any dealers who sell the OM1 below list? The only vendors I could locate are Grove and Opto themselves.

Anyway my opinion is that if you want to use the counter with a scanner that you should consider buying the M-1 from Opto. I own an Opto M-1 and an Opto 2810. The M-1 was purchased about a week ago at the Rochester Hamfest.

The M-1 essentially has two automatic hold features. One is a digital filter. When the filter is on,the counter will hold the last frequency it has counted above the noise floor (until a new transmission takes place). When the filter and the memory switch are both on the counter will hold a received frequency until the memory is toggled for a new reception. There are three registers for frequencies in the memory.

The only thing I don't like about the M-1 is that the three registers don't fill up automatically. The first one is filled and then the user must hit a button so that the first one moves to the second position and then another frequency can be recorded in memory. In practice I am using the filter to hold the frequency instead of the memory. This means I have to use the memory in my head adn keep an eye on the counter.

Another neat thing about this counter is that the light will come on whenever a frequency is received with the filter on. This makes it easier to keep an eye on the counter. That is, the light tells you when to look. (The light can be turned on or off - this is up to the user, too.)

Anyway, I hardly ever used my old counter. I have been using the new one this week quite a bit. The type of things that are easy to pick up are taxis and such. There is also a tendency for the counter to pick up pagers which I think use very high power transmitters.

The Sysop of the Compuserve Hamnet Scanner message area likes his Startek unit. The man that sold me the Opto talked me out of the Startek. The truth is I'm not sure which unit is the better one. There is a mod to add a hold to the Radio Shack unit.

The man selling the Opto at the Hamfest was from Ramsey in Rochester NY. The main feature that he pointed out to me was that the counter counts up to 250 MHz without using a multiplier. He implied that the Startek didn't go as far but I didn't get into really detailed comparison. The other differences had to do with the type of reset on the memory of the Startek, the cost of the Startek with the memory hold and reset (which I think was $249 or more at the Hamfest), the LCD vs. LED situation (Startek still uses LED's) and probably some other things. He really didn't sell me on what I think is the best feature - the digital filter - which acts to hold a frequency in the display until the next one breaks through the noise. I guess I'm sold on the M-1 now.

I updated to an Optoelectronics M-1 about a month ago and have since taken it on a trip to pick up hotel freqs.
The unit works great esp compared to my older more basic Optoelectronics 2210. It has autocapture, digital filter to reduce false "hits" and even an output for RS-232 interface (extra cost option). The unit is backlit and uses LCD screen so it is much easier to see in daylight.

I can highly recommend this unit. Don't know about the Startek units - in ways they seem similar - I can tell you that the store and hold is really helpful, especially if used while driving. The M-1 also has a 3 register memory for storing freqs captured.

the Starteks use LED display
- I found this a major minus in my older Optoelectronics scanner - it shortened the battery life to 2 hr between recharges as well as the problem of daylight visibility.

2012. Re: More Alinco DR600 bugs!

> remote control of this thing. Too bad that is the reason I bought it.

I also have the 600 and the 580. I love them both.

A trick to cross-band repeating that I have come up with is instead of putting the repeater's output frequency in the VFO and setting the offset, just put the input frequency in the VFO without the offset. Here's why:

The main reason I need to use the 600 to retransmit my ht's signal is because the little 1 watt can't make the haul to the repeater. However, I can usually hear the repeater with the ht just fine. In this configuration, I do not get the repeater's output retransmitted on my other band, but since I can hear the repeater ok on my ht, I just tune it in there. I also crank the squelch up on the repeater's input freq band side as high as it will go so that only other stations real close to me are retransmitted.

EX: repeater on 145.49, -600 for access, using 445.900 as my simplex and control frequency

600: 580:
VHF UHF VHF UHF
144.890 no offset 445.900 no offset 145.490 445.900 no offset

I transmit on the HT on UHF only. The 580 is in half-duplex mode so that the band that is not being transmitted on is muted whenever I key up. I monitor the repeater output on the HT on 145.490. With the squelch up on the 600 VHF side, only other stations that are really close to me get heard and thus retransmitted on UHF.

Like I said, this seems to work great, and I have suggested it to other hams in my area so that we don't have people that are waiting for the repeater to "drop" between transmisions because of the way they have their cross-band links setup.

2013. Help(!) connection Kenwood MS-50 Mike to TS-140S

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-02 16:32:55 UTC
From: megabyte@chinet.chinet.com
Message-ID: <Cqs3Aw.HBF@chinet.chinet.com>
Source record: 226544

I have a Kenwood MC-50 mike and a Kenwood TS-140S transceiver. The TS-140 has an 8 pin mike connector, the MC-50 mike, a strange 5 pin plug. DOes Kenwood make a cable to connect these two or am i going to have to build a cable?

If I have to build, does anyone know the pin outs on the MC-50 5 pin plug?

>I am considering the purchase of a TS-850S and was wondering if anyone >out there has used Ham Windows from Kenwood, or any other software >with the TS-850S, or any other Kenwood radio.

>I have a spare 386 lying around that might be very useful interfaced >to a TS-850S.

Hi Lou,

I have a TS-450SAT for one year now, and it has been connected to my computer since day one. The program I use for it, is Hyperlog, and believe me, it is a great help. Per se, it does not let you control you rig, but it reads the frequency and mode directly from it, as you are filling in the callsign, RST etc. It also interfaces to SAM callbook database and GEOCLOCK, to show you the daylight areas (for gray-line propagation).

I have also tried several control programs. One that looks quite decent is a suite comprising of three separate pieces of software : RigView, LogView and PacView. These are inter-working programs that seem to be useful at working with the Kenwood (or any other brand, actually). Unfortunately, althought I bought them, I do not use them, as my log file could not be imported in LogView, even thought the developer did try to help. If you are willing to start you logging from scratch, they look quite good.

Finally, I have a copy of another program, I think it is KENTROL (i.e. KENwood conTROL). This looks also very nice, I can't decide which one's user interface I like better, KENTROL or RigView. RigView emulates the dials and controls of your radio. KENTROL uses scroll bars etc for the same purpose. If my RAM has no parity errors, I think that KENTROL also has a logging part (ain't very sure, but can check if the need arises).

By the way, both the View suite and KENTROL are Windows applications (another reason I never use them, hihi).

I would also suggest that you look in last years QSTs for an interface, which apart from connecting the rig to your computer, allows you also to control the radio's filter settings, with the push of one button only. I build this interface about six months ago, and it proved to be extremely useful.

If you need more info, email me at the addresses below.

>the DJ560 has better out of band sensitivity than the TH78A -- something
>that I for one value.

I wouldn't say that TH-78 has a poor sensitivity in out of band areas.
The reason why I'm saying that is that I tried remove the original
antenna on my TH-78e and discovered that it works like a filter,
so by replacing the original antenna with another antenna i got a
better sensitivity on out of band areas.

There are also another way of increasing the out of band sensitivity,
that is by using the (f2) function-button, in other words: switch 70cm
to 2m area and tune into the area you want to listen to.

And by using both methodes you get a very good sensitivity out of your
TH-78. I have only tested the sensitivity on 150-175Mhz because that area
is the only area outside 144.000-145.999Mhz that I'm intrested in.

BTW, You can also get an extended rx on TH-78e without opening it, that
is by holding down PTT and VFO while power up the RIG (The procedure
may also reset the memories, not sure about that). Those modifications
have only been tested on a TH-78e, but they may also work on a TH-78a.

2024. Info on a NLS Mod. MS-15 Miniscope

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-03 01:05:08 UTC
From: courcoul@itesmcq1.qro.itesm.mx
Message-ID: <courcoul-020694190508@buffy.qro.itesm.mx>
Source record: 226463

My apologies if this group is not the best choice for this question, but I failed to find a better option within those offered by my news feed.

Rummaging thru an old pile of equipment, I came across a Non Linear Systems Mod. MS-15 miniscope; an ancient portable single channel oscilloscope. All that was left of it was the scope proper; no AC adapter, manuals, probes or anything. Also, sometime in the past somebody had removed the rechargeable battery from inside the unit, so that part was also lost.

Would anyone recall or have one of these things ? Before dumping this scope back, I'd like to see if it can be salvaged and put to use. There appears to be no physical damage, and, quite frankly, it is a cute little device, to be consigned forever to the trash heap just like that.

What I need to know is what kind of battery it uses, or at least the operating voltage and the voltage and amperage of the ac adapter.

Thanks in advance for any info.

Greg Hammond measured the sensitivity of the receivers on the TH-78A. According to his results, the bandwidth (at 3dB down) of the main UHF receiver is 25MHZ wide, and centered between 435-440MHZ. The cutoff is quite sharp above 450MHZ, dropping to only 1uV sensitivity by about 455MHZ, and substantially less above that. A better antenna certainly helps, but cannot make up for a deaf receiver.

The sub-UHF receiver is somewhat better, having a bandwidth of about 35-40MHZ centered on 440-445MHZ. Sensitivity drops to 1uV at about 472MHZ, and rapidly gets worse from there.

I consider about 1uV sensitivity to be the minimum acceptable value for use. Given this, the TH-78A has a maximum usable frequency on the main UHF receiver of 455MHZ, and on the sub UHF receiver, 472 MHZ.

As it turns out, Kenwood uses a bank of 3 helical resonators to tune the main UHF receiver in the TH-78A. The bandwidth is fixed at 25MHZ, but the center point of the band can be adjusted substantially via the adjustment screws on the resonators. Greg claims that when fully screwed out, the resonators peak at about 478MHZ. When they are peaked this high, the main UHF receiver sensitivity is very poor on the ham band, but the sub UHF receiver can be used to monitor the ham band. Anyway, I intend to play with the resonators this weekend to see if I can achieve a compromise I'm happy with. I'll probably just wind up peaking the resonators at 450MHZ instead of 435-440MHZ as they are set at the

factory.

: There are also another way of increasing the out of band sensitivity,
: that is by using the (f2) function-button, in other words: switch 70cm

: is the only area outside 144.000-145.999Mhz that I'm intrested in.

There are also adjustments that can be made to affect the VHF band coverage as well. Inductors L36, L38, and L43 all adjust the VHF band coverage. However, I suspect it will be more difficult to adjust these inductors properly without good test equipment (and quite possibly a Kenwood service manual) than it will be to adjust the helical resonators (L32 on the schematic). Anyway, the VHF coverage on the TH-78A is more-or-less acceptable to me at the present time.

I bought the base-model MFJ HF unit back when it was the only choice.

Its strength is that it is cheap and effective. However, you really need your calibrated receiver to set the frequency. If you're going to use it more than a few steps from the receiver, the counter model is well worth while. And considering how annoying it often is, practically speaking, to use SWR to set up VHF antennas, the extended range would be really useful.

In spite of some of their weaknesses (e.g. susceptability to being thrown off by strong RF fields), for maintaining the backyard antenna farm they are terrific. And as a low-QRM and gentle-to-the-finals way of adjusting the transmatch, they are also great.

I can't comment on the AEA item, but it strikes me as a bit overprice and overkill.

Greg

2034. Old CRT Reference Data?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-03 16:10:37 UTC
From: keithd@netcom.com
Message-ID: <keithdCqtwxp.8DL@netcom.com>
Source record: 226468
Cross-posted to: sci.electronics,rec.radio.amateur.equipment,rec.radio.swap

I know there exists some kind of documentation of vacuum tube reference data, that should cover CRTs. I have a really old TV I'm trying to restore, and the filament on the CRT reads open circuit. I've chased down several leads for finding old tubes that were recently posted, and I found a couple of companies which will sometimes have such old tubes, and one company that will rebuild old CRTs if they can get the electron gun for it, but so far nothing has panned out.

What I've got is a 7JP4, a 7 inch round CRT that uses deflection plates, not deflection coils. I'm thinking that if I can get the reference data, I may be able to find a tube that is available that is similar enough that I can modify the circutry to suit. This TV uses a serial filament chain off the line voltage (yuk!), but I could always stub the CRT out with a resistor or choke or something, and supply a seperate filament transformer if the filaments differ. In addition, if the plate voltages differ, it seems like it might not be too hard to tweak things to a certain extent, this particular TV has loads of adjustments in that area anyway, and I do have a little experience building experimental circuits for deflection plate CRTs (though we're talking about 20 years ago, now). Also, I could find the tube in another old TV and check the Sam's schematics for ideas on it's use.

The old TV is an Airline (Wards) 84-HA-3002, a wooden box the size of an old record player, with a round screen and 13 buttons for channel selection (including Channel 1). It's complete and in pretty decent condition, considering it was made in 1950. If I can find something for the CRT, it seems definately restorable. I got it from a junk shop that had 8 or so TV's of this vintage for about $50 ea., none working. THey may have been rejects from a more serious collector-restorer who couldn't get the parts, so I may be in trouble. I picked this particular one because it was the only one that had all the front panel knobs, and a note on it said no power, I figured a power supply problem would be pretty easy to fix, and didn't automatically think that the CRT or flyback HV (there isn't one for deflection plates anyway) was bad. Turns out the reason there's no power, is the CRT filament is out in a serial filament string, so there's no filaments at all. Ok, I gambled and I lost. Unless I can devise a solution for the CRT.

It's been so long, I've forgotten what kind of reference material on these old tubes are available. I went to the library, and the catalog listed a Sams tube substitution guide (labeled 1990), but it was missing from the reference section, and I'm not sure it would have the details I want anyway. Somewhere in my piles of stuff I have an old copy of Reference Data for Radio Engineers, but I don't think it went to quite the detail I need

either, though my memory of what was in it is pretty foggy.

So does anyone remember what reference materials had this sort of info? Ideally, a source for a 7JP4 is what I really want, but if one doesn't turn up, I'm willing to try to adapt another one.

Oh, and so far, I've tried these folks for a source of a 7JP4:

Antique Electronic Supply, Ltd.
6221 South Maple Avenue
Tempe, AZ 85283
Phone: (602) 820-5411
Fax: (620) 820-4643 or 1-800-706-6789

These guys have old tubes, but no CRTs.

Vintage TV & Radio
3498 W. 105
Cleveland, OH 44111
216-671-6712

They have some CRTs, but no 7JP4.

Superoir Picture Tubes
14 Rooseovelt Ave
Carteret, NJ 07008
908-541-9354

They rebuild CRTs if the electron gun is available. Apparently not for the 7JP4, though I may yet get a call from them, if one turns up.

Harry Poster
New Jersey

I had one of these. The batteries are 2 volt lead acid D cells with solder tabs that fit the board. They were made by Gates. Replacement sets ran about $45 from NLS. The scope won't run off it's supplied AC adaptor without batteries in place. It doesn't supply enough current. However, you can run it off a heavier supply. There's a regulator on the back panel. Feeding it between 9 and 12 volts DC will run the scope. I don't remember the plug polarity, you'll have to trace that out from the wiring. I think it was standard American positive inner, but check it out yourself.

> RF fields?

The best computer systems I have seen for RFI filtering and low subseptability are those made by Apple computer. The Macintosh line is extremely RFI quiet, and the interface pins are filtered with appropriate EMI filtering. All cables are shielded, and the "toaster" varieties (Plus, SE, Classic, Classic II, Color Classic) have the advantage of filtering the monitor.

The only problem I've encountered is with ADB keyboards, who generate a teeny bit of hash on 10m. Better antenna separation would probably eliminate that. (The leakage is THROUGH the keyboard, not the cable or case - kinda hard to eliminate)

For even better RFI supression, I suggest the PowerBook line of notebook computers. I have yet to hear a peep out of my PowerBook 100 on any band.

Message-ID: <2sobdq$c96@fido.asd.sgi.com>
Source record: 226460

Bill Dorsey (billd@engr.sgi.com) wrote:
: As it turns out, Kenwood uses a bank of 3 helical resonators to tune the
: main UHF receiver in the TH-78A. The bandwidth is fixed at 25MHZ, but
: the center point of the band can be adjusted substantially via the
: adjustment screws on the resonators. Greg claims that when fully screwed
: out, the resonators peak at about 478MHZ. When they are peaked this
: high, the main UHF receiver sensitivity is very poor on the ham band,
: but the sub UHF receiver can be used to monitor the ham band. Anyway,
: I intend to play with the resonators this weekend to see if I can
: achieve a compromise I'm happy with. I'll probably just wind up peaking
: the resonators at 450MHZ instead of 435-440MHZ as they are set at the
: factory.

Well, last night I opened up my TH-78A and removed circuit boards until
I got to the RF board. After locating the bank of 3 helical resonators,
I carefully marked the position they were originally in and proceeded to
back them out 1 full turn (the most I could get on one of them was only
1.25 turns anyway). After putting the unit back together, I turned it
on and proceeded to check out its performance.

Now, rather than being almost completely deaf in the upper UHF band
(around 480MHZ), I had no problems hearing local public service trans-
missions. Switching back to the UHF ham band, I noticed a reduction
in sensitivity, but it's still sensitive enough to work the local
repeaters without a problem. Besides, I can use the sub-UHF receiver
if I really want good sensitivity on the ham bands.

Since the helical filters in the TH-78A are inductively coupled, the
cutoff tends to be much sharper at frequencies above the resonant
frequency than below. This explains why I still have reasonable
sensitivity in the ham bands as well as good sensitivity in the public
service bands I want to monitor.

BTW, I noticed that the antenna Kenwood supplies with the TH-78A is
quite decent on the UHF band, but pretty poor on the VHF band. If
anyone wants better VHF performance, replacing the antenna is a good
place to start.

2044. Hallicrafters SX-28?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-03 22:55:07 UTC
From: jng@sli.com
Message-ID: <JNG.94Jun3175507@ravel.sli.com>
Source record: 226396
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I've come into possession of an antique Hallicrafters SX-28 "Super Skyrider" receiver. Not being a ham, I'm looking for advice on what to do with it.

For the uninitiated, the SX-28 is an antique receiver with enough dials on the front to run a nuclear power plant singlehandedly. Its construction is sturdy enough to do a tank proud, and it's in good shape as far as I can tell.

I don't know exactly when it was manufactured, but the manual (which includes full schematics) is dated November 1, 1943. The front cover says "frequency range - .55 to 43. megacycles (!)".

This receiver is obviously obsolete by today's standards, but may provide hours of fascination for the right hobbyist. It's so old, it may even be worth money.

Questions:

1. Is there a market for antique receivers like this?
2. About how much might it be worth?
3. Where might I advertise it if I wanted to sell it (other than this group)?
4. If it's not worth selling, how might I go about finding it a good home?

I never read this newsgroup, so please e-mail responses to me: jng@sli.com
If I get any good advice, I'll post a summary...

Thanks,

Mike Gilbert jng@sli.com

I must be lucky. I have a 386 system I hacked from nothimg but a poorly-fitting, cheap knock-off cabinet, < $20 keyboard, and no attention paid to any of the cabling or connectorization anywhere. This mess seems to be silent on 160 thru 10. My 757gxII is sitting right next to the PC who even has all of the unused drive bay covers missing cause they didnt fit :(

Not trying to be a smart ass, just an observation. Why is it some have to work hard at RFI reduction and for others it just falls in their lap?

Aside from the controller, the price I mentioned also includes the case
and power supply and cabling and a warranty. I still think the asking
price is a bit high...But that's just MO.

> satisfaction. I love my 530 despite it's quirks, and I'm sorry to
> see someone else have a bad experience with one.

I loved the 530 for the five days I used it. It was a nifty little rig.
But the problem was the turning point in my owning that rig again. After
this episode, I will be going back to that dealer from now on. I thought
he handled it with a great deal of courtesy and dilligence. He is a hell
of a drive away, however, and traffic around his area is awful during rush
hour...

The IC-W21AT that I replaced the 530 with is still working great.

I do think there are a number of things that can be learned from this by
all the companies... if you have a batch of rigs go out that have problems,
get 'em fixed now. Don't wait for the ham store to call you and then tell
them.

This was the third Yaesu I have owned - FT-207, FT-211, then the 530 - so I
feel confident in Yaesu products... but what about a new ham that just bought
his/her first rig? Had they received the 530 instead of me, what would that
have done for Yaesu's reputation? Not too darn much. The same goes for
ICOM, Kenwood, Alinco, etc.

PN> I have heard stories about the FT-530 and intermod. Does it
PN> pick up more intermod than other compareable dual band ht's ?
PN> I live in San Jose, CA and there is RF EVERYWHERE !
PN> 73 de Paul KD6OCZ

ANY radio that will receive from DC to blue light IS going to
suffer from intermod. I don't own an FT-530. I do own an Alinco
DJ-580. It, like all others of that ilk, has it's "front end" wide
open. How else can these radios copy such wide frequency ranges?
The only way to keep out intermod is to make the "front end"
tight. Like the Radio Shack 2 meter talkie. It does not suffer
but the only things it can hear are between 144 & 148 Mhz. So
you have to take the bad with the good. BTW *NO* conversation
whatsoever will "open up" a tight radio like the RS one and
many others. But listen to the owners of those bitch about it.

2058. Re: SWR Analyzers

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-04 20:00:21 UTC
From: arl00@ccc.amdahl.com
Message-ID: <1994Jun4.200021.20288@ccc.amdahl.com>
Source record: 226479

I had one of the MFJ analyzers (believe it was the 249) for a couple of days. Worked okay, but according to my Startek frequency counter, the MFJs frequency generator was not particularly stable. On power up it would drop a few Hz every second. The drop rate slowed after warm up but was still definitely there.

That made the unit practically useless for my intended purpose, i.e. producing graphs of antennas SWR vs frequency. By the time I was done with a frequency range, the reading for the first points were always markedly different if I took them again. I've seen messages in other venues complaining about the same problem...maybe MFJ has a fix by now.

On the other hand, if all you need to to is locate the resonant freq
resonant freq of an antenna system, the MFJ will probably meet your
of an antenna with
needs.
I looked at the AEA but had no desire to spend that kind of cash, especially in light of the fact that they have the kahonnes to charge extra for the software that lets you dump measured data into your PC for more sophisticated analysis. For the big bucks they're asking it should be included.

2060. WANTED: Low RFI laptop

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-04 22:06:48 UTC
From: wy1z@bach.coe.neu.edu
Message-ID: <WY1Z.94Jun4180648@bach.coe.neu.edu>
Source record: 226482

I live in an apartment where I cannot put anything out the window.

So, I have a longwire around the ceiling of my bedroom as an antenna
for my shortwave radio.

I recently received a new AEA PK232MBX multimode TNC, and wanted to try and
receive some digital modes.

All is fine, except the signals sound a bit noisy from what I was used to
with the same radio, but with the computer turned off.

So, I experimentally turn the computer off, and the signals really come to
life.

I have a partially working NEC Ultralite PC-1701 (display is broken), and
tested its RFI with the radio. Didn't seem to cause much, if any, problems.

I think the laptop may have other problems, too, but it turns on, which was
enough for my tests.

Now, if someone has a spare, WORKING, NEC 1701 or 1702 laptop, with serial
cable, power supply, and battery, please let me know.

As I don't have much money (spent a semester working on a COOP job to pay
for college, and just spend one check's worth on the TNC), I am really
tight on money.

I would like to negotiate.

If someone has any laptop, which WORKS, that they are willing to sell,
please let me know.

Thanks much!

Scott

This is an excellent unit; I have used one for several years. Be warned
that the relays are small and will not withstand more than the rated power.
The antenna base should be well insulated for the expected RF voltages.

Hello everyone,

I am a in need of the documents/schematics for the following:

Heathkit Power Amp.
model HA-202

If you have them and would be either willing to negotate for them
or make a copy of them, please e-mail me. The Heahtkit power amp
ha-202 is a 2 or 3 transistor c-class that had the option for a nice
black case with fins on top. Very nice design, and unfortunately, something
has gone wrong with it. I am representing Synton Amateur Radio Club
of the University of Illinois for this, so it would benefit a ton of
people if you decide to contact me. (we misplaced the documents
unfortunately)

sorry about that last line there.

73's et hope to speak with you soon,

Allen Hall n9rzc@uiuc.edu
Pres. of Synton ARC UIUC (W9YH)

IE>old IC-735.

IE>Ed Raso, WA2FTC

Ed -

The 757GX has so far been the best piece of amateur equipment that
I'v owned. This year will mark my 8th year of ownership. I'v had zero
problems, the radio has required no service and it has been used
extensively for mobile operation.
I believe the current market value of a used FT-757GX is in the
neighborhood of $600-700.

Remove the battery and look inside the unit. You should see the serial
number clearly printed at the inside bottom edge of the front panel.
According to Kenwood, units with serial numbers beginning with 510 and
above cannot be modified to receive the 800-1000MHZ band.

I got the latest mods by ftp-ing to oak.oakland.edu and looking in the
ham radio directory. Why don't you give that a try?

> Can anyone tell me where to get the FAQ on getting started in amateur radio?

The best and most readily available FAQs are the books sold in every
Radio Shack: the ARRL's _Now You're Talking_ and Gordon West's Technician-
class license manual. They will get you off on the right foot.

If you'd like to save some money, take a look in your local library.
The books they have will give you all the general principles of ham
radio, but the rules and exams have changed a lot in the last few years
so you will want to buy an up-to-date license manual anyway.

Followups to rec.radio.amateur.misc, please.

I've been using Duracell alcaline batteries for some time. Rayovac has just come out with a unit that recharges Rayovac alcaline batteries. The unit has a warning that attempting to recharge other alcaline batteries can damage the batteries, the unit, or both. Does anyone know whether this warning is anything more than an attempt to get customers to buy only Rayovac batteries? I.E. will the charger recharge my Duracells? Thanks.

The anode contacts in the Rayovac charger are keyed so as not to work with other brands of batteries. It is rather easy to defeat the interlock; the methods for AA/AAA and C/D cells are different.

The charging rates and voltage cutoffs on the Rayovac charger are designed to match the Rayovac cells. If you try other cells, you run the risk of exploding them - especially if you leave the cells in long enough expecting the charger to shut itself off when they are "done".

If you're careful, you will find that the Rayovac charger will rejuvenate regular alkalines that have not been discharged too deeply -- just like the Buddy-L, Remington, and Innovations chargers. But this is not a very effective process, according to people who have tested these devices and posted on other newsgroups last year.

It is positive inner. I have one, and it's a nice little thing, which
I store under my bed.... It's just enough scope for someone like me
who didn't really need a scope, but always wanted one :-). I got mine
cheap with the internal batteries intact but shot due to old age,
apparently. The included power supply will run it, but bear in mind
that it puts out half-wave rectified, unfiltered power, which the
batteries would filter. I attatched a capacitor and it works fine for
me. I just measured a 0.75 amp current draw.

2081. HT pouches 4sale(FT-11R especially)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-06 06:14:50 UTC
From: ddevera@bbs.dsnet.com
Message-ID: <T8iHNc4w165w@bbs.dsnet.com>
Source record: 226408

****

VERSA-POUCHES

****

!!!!!!2 VERSIONS!!!!!!

YAESU FT-11R and small HT owners,

For those of you that have requested HOLD DOWN STRAPS on the VERSA-POUCH,

We now have another version of the VERSA-POUCH with hold down straps. Which

holds down your HT and prevents it from falling out of the case.

Because of this new version, the CASE PRICE will slightly increase to 6.00 per

case, 5.50 for 2 or more. If interested please send a reply message ASAP.

The makers of this pouch will only produce, these POUCHES with hold down straps,

by request. So let me know how many you want and we'll take it from there...

Depending on the size of the order, it'll take 1 day, for single pouches to

1 Week plus, for larger orders. Also, because of this NEW VERSION, the VERSA-

POUCH can be customized to fit MOST small HT's, but you'd need to pay & order

in advance.

PRICE BREAK DOWN:

MODEL #: VP-1-NS

Regular Pouch, no hold down straps = $4.00 or $3.50ea. for 2 or more.

MODEL #: VP-1-WS

NEW VERSION Pouch, with hold down straps = $6.00 or 5.50ea. for 2
or

more.

Even for $6.00, you still can't go wrong!!!!

PLEASE DO NOT FORGET TO INCLUDE SHIPPING...

Thanks again to many of you for your interests and suggestions... SPREAD
THE

WORD...

73 David.

They are both dual bander (144 & 432 Mhz) portable transceivers.
I just got my license and want to buy one of them.

ASK ME WHAT'S THE BEST :
- in modulation
- in reception
- in transmission
- in quality of fabrication
- in optionnals and serials equipment ...

Thanks to all,
Best 73+51.

From: nacecdp@enh.nist.gov
Message-ID: <6JUN94.13453519@enh.nist.gov>
Source record: 226412

My MFJ keyer adds an extra dit after the first dah (intermittant), so that a 3 di di di da dah comes out as an SK di di di da di dah. It is NOT RF since this happens without it hooked to the rigs, I have replaced all the .01 mdf caps on the dot & dash lines, I tested other caps for the .22 & .33 mdf caps and other 1N4148 diodes. Nothing has worked so far. I even tried a pull-up resistor on the dot line. If anyone has ideas please send them to:

I have the copy of the Ten-Tec "T-Kits" catalog. They currently have about
27 kits listed - and at excellent prices!!! More are coming. I called
Ten-Tec with questions about the 6 meter transverter and they faxed
me a copy of the schematic - verrryyy impresive (16 transistor circuit).
call them at 615-453-7172 for a catalog. I plan on purchasing several
of the kits in the catalog.

2090. Help On Selection of 2M HT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-06 17:53:18 UTC
From: robin@ayjen1.ayo.dec.com
Message-ID: <2svnqe$snt@usenet.pa.dec.com>
Source record: 226417

Hi,

I`m currently on reclocation in WA for a couple of months. I would like to get myself a 2M HT. Last time I bought one of these was about 10 yrs ago. I was wondering if anyone could give me any experience or advice on what to buy. On comment I can make on what I`ve seen so far is that ICOM seem to have a bewildering array of HT`s.

My requirements in order of priority are loosely these : -

1) Small-My Wife wants to be able to carry it in her purse comfortably.
2) MODIFIABLE for the UK Tone Burst.
3) Pager Function.
4) Easy To use.
5) Good Performance.
6) Ease of use in the car.

Any comments advice would be gratefully received.

Robin Alexander (GM4YED awaiting the arrival of reciprocal permit!!).

From: kn4aq.gary@mms.raleigh.nc.us
Message-ID: <9406062036.0SY5D00@mms.raleigh.nc.us>
Source record: 226420

Has anyone had experience with any of the new VHF/UHF radios that advertise 9600 bps packet compatability?

Some questions that come to mind include...

connector compatability - is there any?

IF filtering - do they widen the filters for packet reception?

T/R switching times - how fast are they?

1200 bps connections - through the "packet" connector, or the mic/speaker jacks?

TNC/radio interface standards - are there any?

anything else?

Information on these radios seems scarce. Thanks for your reply!

I talked with somebody at Ten-Tec he said that they had to make some changes to
the 6 meter transverter and it would be out soon. I think I would rather have
one that worked a little late than one that didn't work right a little sooner.

My buddy N3MEQ approached me to help a fellow ham with a hearing problem. He likes to contest a bit, uses NA, likes CW, and wants to try a code reader. I used to have one.

Budget is limited. If you may know of a stand-alone code reader, like the Kam or AEA, or have a software/hardware solution to reading some CW on the screen while still in a contest type of mode, please let me know.

E-mail here is fine. Preferable address is penneys@pecan.cns.udel.edu.

Tnx Bob

Bonjour, Laurent

: I'd seen in a shop a hand held tranceiver made in Taiwan, the brand
: of that device is REXON. It is a very low cost VHF emetter/receiver,
: but it looks like the Kenwood pocket TX. Is there anybody who have ever
: use that
: kind of TX, if so is it valuable ? How about the quality ?

Yes, I have been using the RV100 (2m version) for a couple of years, and
you can bet I havn't pittied the poor Rexon a bit: I carry it almost where
ever I go, and it has slipped a couple of times from my clomsy hands, even
so that the battery compartment had to be replaced, but, it looks like
there still is a chance you can get value for your investment: The rig is
working 100 % after all the rude handling I've given it.

Just as a nice extra (which was one reason why I accepted it) comes the
no-screwdriver-needed modification to RX & TX range 130.000-174.995 MHz
(which I, ofcourse, needed only for measurement purposes, for repairing
VHF equipment).

: Thanks in advance, Laurent.

2099. isuzu amigo and hf glitch

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-07 05:04:10 UTC
From: n4tii@kd4nc.uucp
Message-ID: <1994Jun7.050410.22105@kd4nc.uucp>
Source record: 226426

Howdy....

I recently installed a temporary mount for an HF rig in my 1990 Isuzu Amigo. I have 2m, 220, 440, and a DC to Daylight scanner in there also, but it is permanantly in there...

Anyway, I put me a 3/8 x 24 mount on the spare tire thing and hooked up my hf power cable to my power block I put under the seat...and when I keyed up with about 100w on 10m (28.425 I think) the intermittant wipers kicked on...

Anyway, it was not raining, so I really couldn't use this "feature."

I did tune up an HF 'bumstick' style whip that I have on CAP freqs very well. No RF problems, bites, or unusual 'features' in the car on that rig...just the widshield wipers on 10m.... I did not try any other band...only tried two frequencies - 4469 and 28.425.

So...any recommemdations??? The rig was NOT grounded to the frame...only ground was on the (-) lead on the power...

There is a good ground at the antenna mount.

Thanks in advance!

John

What band? The 450-470MHz puppy I have moded very nicely into handling a
local repeater I am on at 440.6 repeating to 445.6. Tuneup was quite easy with
one possible exception. The first stage if the input filter doesn't "feel"
like it tuned up quite right. I have not metered it for sensitivity yet. I've
instead been cracking the synthesizer programming codes. I could calculate
TX and RX codes for frequencies you request if not too many request them.
I also have cracked the PL generator coding. But the codes are generally
supplied in the manuals so that'd no big deal.

SOMEDAY we might be able to make available a goodie to plug into the
ROM socket and allow such silliness as RS232 based frequency and PL entry.
(We have frequency entry working fine now. But we've run out of "chip"
with just that and have no room for preprogrammed frequencies, saving
frequencies to an EEPROM, or coding PL frequencies. So we're moving to a
different chip. It'll be awhile....)
{^_^} Joanne Dow, Editor Amiga Exchange, BIX
jdow@bix.com
(Given the right data I could maybe generate 2 meter frequencies
as well. But I have no manuals for them nor interest in 2 meters.
Here in LA 2meters is um ah depressing.)

I have two o-scopes for sale: a B&K dual trace 30Mhz and a Tektronix dual trace 100Mhz. Make me an offer. rogerj@apex.com or (206)432-9241 eves.

2105. Wanted: Fluke 8600 DMM Diagram/Manual

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-07 12:44:02 UTC
From: neidorff@uicc.com
Message-ID: <Cr121E.DCo@uicc.com>
Source record: 226434
Cross-posted to: misc.wanted,ne.wanted,rec.radio.amateur.equipment,rec.radio.swap,sci.electronics,sci.engr,triangle.forsale

I have a 1975 vintage small bench digital multimeter made by Fluke.
It is their model 8600. The analog circuitry (A/D converter) seems
to have lost its brain. It always displays full scale.

This would be much easier to fix with a schematic diagram. Does
anyone have one to loan, copy, FAX, scan, or otherwise help me?
I'll cover nominal costs (copying, mailing, etc).

Please reply directly to me any of the ways listed below.

Thanks for your assistance.

: on what to buy. On comment I can make on what I`ve seen so far is that
: ICOM seem to have a bewildering array of HT`s.

: My requirements in order of priority are loosely these : -

: 1) Small-My Wife wants to be able to carry it in her purse comfortably.
: 2) MODIFIABLE for the UK Tone Burst.
: 3) Pager Function.
: 4) Easy To use.
: 5) Good Performance.
: 6) Ease of use in the car.

:
: Any comments advice would be gratefully received.

I used my Kenwood 78A while mobiling around the state of WA a couple of years ago, and really enjoyed it. You guys have lots of linked 2M and 440 repeaters up there. The 78A does have the pager function, and just about every other major bell/whistle that's out there. I don't know if it is modifieable for the UK tone burst, although I believe that the European model (the 78E) comes with it, so maybe it is. (You could call Kenwood).

Ease of use: the design philosophy is to program the functions to the memory channel, at which time the radio is very easy to use. Programming the 78A usually involves having the manual handy though.

The alphanumeric display is very nice. With the $25 ME-1 memory chip, the radio has 125 alphanumeric memories, which is particularly nice if you travel, since you can program big chunks of channels by geographic area without deleting your home channel stuff.

I really like my 78a. It is a good radio.

-->
-->Greg

The AEA HF 121 is a great instument. Yes it is expensive, but
it is a device that has no rival. It can save hours and
lotsa headaches tuning a multiband antenna and making a quick
check on an existing system.

It is amazing to set the display to it's maximum bandwidth
and then hook up an R5 or a G5RV to see all the dips.

Some devices are expensive but worth having. Consider the Bird
wattmeter, ~$300 plus slugs. But it will last you forever.

Well of course it does, John. NTSC video is transmitted positive sync,
IE peak amplitude is sync tip, black is 62.5% modulation, and white is
12.5% modulation. You need to invert the signal, a single common emitter
class A stage does nicely, and you need to do DC restoration via either
a sync tip or back porch clamp circuit. (If you don't want to build these,
they're in ordinary TV sets. All you have to do is put a switch at demod
out of the TV and a jack on the back so you can insert your demod video
into the TV instead of the TV's demod video. The inversion and clamping
are already there for you in the TV's initial video stages. Monitor_in
jacks on TVs use a point beyond the inversion and clamp circuit since they
expect the "in house" negative sync used by VCRs, cameras, etc rather than
the positive sync "off air" signal.)

I have a friend that is taking a extended backpacking/kyaking trip to the Northern part of Alaska. He was told that he needed a handheld Aircraft band receiver. Does anyone make a handheld that would operate on the aircraft band as well as the marine or one of the ham bands? Can a modifcation be made on a radio to make this happen? Who makes sturdy aircraft/marine radios? Does anyone have one they want to sell for a good price?
Does anyone have a list of frequencies that it would be advantageous to be able to transmit/receive on for the Brooks Range and Artic Ocean area?

Locally, we have had the same experience with VHF and UHF micors (tx
& rx) that we put into repeater service, voting receiver service, and
packet service. If you're patient, you can find radios that are in
the right range to begin with (eg 136-148) but the more common splits
(150+ and 450+) will work also. Low band models do need to be
modified (for 10M & 6M).

My favorite Micor story is from Dayton. There was a guy pulling his
~3 year old daughter along in a little red wagon as he browsed the
flea market. A few hours later, I saw him again. The wagon was
sagging under the weight of at least 6 micors and the 3 year old was
walking. Maybe you had to be there...

>have done for Yaesu's reputation? Not too darn much. The same goes for
>ICOM, Kenwood, Alinco, etc.
>
The Yaesu FT530 was the first radio I ever owned....picked it up the day I got
my callsign...just over a year ago now.

It has its problems. The first was the antenna, which Yaesu sent to me free
right after they got the warranty card. The second is some minor firmware bug,
they offered to swap the radio at no charge (except to ship it to them)...but
I didn't feel that the problem was serious enough to give up my radio for a
few days.

The radio has been running solid as my main packet radio (on my Packet BBS) for
the last several months....it does get a bit warm.....I could use a little be
more umpf to get in more solidly with the node.

I'm thinking of getting another radio soon, and it'll probably be another one
of these radios......I haven't quite decided if it has to be a dual band HT or
not.

The only activity on 440 is linking, and people crossbanding so they can get
to the repeater from poor locations....but our new local area repeater should
solve that problem. If having a HT at 0.5W can talk to a person at the other
end of town to a person with an HT in his basement at 0.2W....it'll do even
better with 20W, though there is some question about its receive sensitivity.

: I had one of the MFJ analyzers (believe it was the 249) for a couple of
: days. Worked okay, but according to my Startek frequency counter, the
: MFJs frequency generator was not particularly stable. On power up it
: would drop a few Hz every second. The drop rate slowed after warm up
: but was still definitely there.

I bought the MFJ259, the new one with the impedence meter. The price was far better than the AEA, but I have no comparison... The MFJ is easy to use and seems accurate but as Arlan states it has a BIG drift problem. I just sent my new one back to MFJ because one of the LCD numbers had erratic segments on it....... MFJ should be able to clear up the problem with the segments/number, but what about the seemingly rapid downward drift? Does it matter if it screams downward at a few Hz/sec? I don't know. If at any time I take a reading when first turned on it agrees with the readout on my TS440, it should be close enough for me.

The board inside says Optoelectronics. The board on the MFJ 249 also said Optoelectronics..... Does anyone have one of the Optoelectronic Freq Ctrs? Do they drift that fast or is it just with the MFJ/Opto counters??? If so, are there drift differences between the few different models Opto produces?

Bottom line, I would like to see the drift corrected, but I can live with it for my purposes. Knowing what I know now, would I buy another? Probably not. I would check out the accuracy/drift of the AEA, and if acceptable, buy it.

I am confused...I don't have an EE , so talk a little 'stupid' to me!(grin)

OK..are you familiar with this military receiver? To get any kind of TV signal,
I change the IF on it to 2000khz, and put it in AM mode, tune to a signal,
(a la 497 something - channel 17 wtbs). the rig has a bnc jack labeled 'video
output' .. i run this to a composite IN on my monitor of the computer, and
I get an inverted black and white picture that is all bent ... looks like those
INDEGESTION commercials of the early '80's...

Tell me what must be done to get NTSC video out of that port on the back.

John
(you can follow up by email to the address in the sig...leave me email with
a phone number to call...it is toll free for me to call into atlanta!))

Version 7.x is correct.

When I teased Kantronics' Karl Medcalf (WK5M) about their ability
to make new versions faster than I could buy them (I just got
version 5.x late last year!), he just shrugged and suggested
I buy the enhancement board.

I saw that board for $89.95 at last Sunday's hamfest.

From: bart@chinook.halcyon.com
Message-ID: <2t3h20$t7f@nwfocus.wa.com>
Source record: 226349

Hi! I am trying to help an American ham radio operator in Africa get his Kenwood TS-140 radio set up on packet radio with a KAM Plus. His brother and I are sending the TNC to him, but we don't know what kind of connectors the TS-140 uses. More specifically, does the TS-140 use the older 4 pin mic connector or does it use the newer 8 pins connector? Also is there an accessories socket on the back that could be used to supply 12 volts DC to the TNC? If so, does anyone of you know what kind of plug is needed and which pins are used for +12 volts and ground, so we can purchase the connector and prewire it before sending it to Africa. The radio is literally in the bush with a generator being used 2 or 3 hours in the evenings. It is difficult to set up a solder station, so we are trying to make everything "plug and play" when we send it.

Thanks in advanc for your help. Please email any information you have on the TS-140 connectors to:

In a previous article, eraso@pd.org (Ed Raso) says:

>I'm considering buying an FT-757GX...I'd like to hear from anyone
>that has experience using this rig, including current market value.
>
>
Ed: Love my 757gx. Bought it used with the HD p/s and mobile mic for $800.
That was in '88 I think. This rig was VERY clean, like new, low hours,
orig boxes, etc. (and i knew the guy). I cant say enuf good stuff about
this rig. Last year I made a HUGE improvement: put a Heil element in the
desk mic. This year got the Heil headset-mic combo. Don't know current
price for clean used rig but don't buy the solid-state p/s (it's noisy).
I would guess current price about $600-700.(with or w/o p/s). Check the
Yellow Sheets....always lots of good stuff.
Good luck --- 73, N9AVP

2126. Recommendations for 2m/440 mobile wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-08 07:34:48 UTC
From: kucharsk@netcom.com
Message-ID: <kucharskCr2IE1.D2t@netcom.com>
Source record: 226351

(My apologies to those who have previously read this in rec.radio.amateur.misc;
I forgot to crosspost it here.)

I'm looking for a smallish 2m/440 mobile radio for use on a temporary basis in
my car. Basically, I want to use it as a very transient system -- cigarette
lighter power, ground clip to chassis, mag mount antenna on the roof, unit
Velcro(tm)ed to my car's carpet.

Possible units:

* Yaesu 5100. My current leading frontrunner, as I want dual in-band
capability and don't need a detachable faceplate since the whole unit
will always be coming with me.

* Kenwood 732/733. The 733 is newer and is price-comparable to the 5100,
but AES has a nice price on the discontinued 732. The Kenwoods lack a
backlit DTMF mic, though (it seems like it would be a nice touch at
night.)

Usage will be for commuting and SKYWARN.

Basic questions on these (or other recommended units):

* Do they have built-in speakers of any type, or do I need to add an
external speaker to the list?

* Do most newer units have built-in and/or defeatable antenna multiplexers
(e.g. just hook up a dual band mobile antenna and go)?

Please reply via email, and I'll summarize if there's interest. Please feel
free to tell me if my proposed system won't work as well.

Its a nice little SSB rig. I've had one around for 10 years or so with no problems. I don't care much for it on CW though. Too many signals leak around the CW filter causing high pitch birdies. For this reason I find it difficult to use on CW without an audio filter. Perhaps they improved this on later models.

> ads.

ICOM was having a coupon sale then. In April and May, the street price went back up to $500. (HRO was asking $499. I know because I was looking in April. I got a Standard C558A, instead.) I called around yesterday and discovered that ICOM is couponing this month so the price is lower again and the unit is readily available at a reduced price. I'll bet the people who bought them in April and May are going to be plenty upset, though!

You're right in your implication that it's not necessary to go to a Tour America stop to get the lesser price and the news of the coupons probably wasn't worth posting.

This *does* raise an issue worth discussing, if only there were something we could do about it--namely, the way many manufacturers jerk their prices around to make it difficult for the newcomer to the hobby to figure out what's going on.

-The board inside says Optoelectronics. The board on the MFJ 249 also said
-Optoelectronics..... Does anyone have one of the Optoelectronic Freq Ctrs?
-Do they drift that fast or is it just with the MFJ/Opto counters??? If so,
-are there drift differences between the few different models Opto produces?

The Opto board in the MFJ analyzers is the frequency counter, and is as
stable as any of the non-ovened counters. The oscillator, on the other
hand wanders all over the place. I cleaned mine up a bit by resoldering
most of the joints (touch the iron to a joint and watch the rosin boil out...),
clipping excess component leads, and soldering the variable cap to the
board. More of MFJ living up to their Mighty Fine Junk name. It still
drifts a bit, and the cap leaves much to be desired, especially on the vhf
setting. It still is a useful tool, as long as you keep an eye on the
frequency.

I also added a resistor and diode across the power switch so I can charge
the nicads in mine without unscrewing the case...

Oh no! Of all people Hallicrafters should have know better than to say
`megacycles' instead of `megacycles per second'. They must have been some second
rate company. No wonder they went out of business; probably all you Mc/s
people boycotted them in protest.

2135. Bought Standard HT recently?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-08 20:56:42 UTC
From: jerry@hnrc.tufts.edu
Message-ID: <1994Jun8.155643.2454@hnrc.tufts.edu>
Source record: 226360

In April, I purchased a Standard C558A from HRO. Last week, I saw an HRO ad, expiring July 15, offering a free speaker/mic from Standard with proof of purchase of the C558A. I called Standard to ask how long the bonus had been in effect and was told April 15 to July 15, but that they would probably act favorably on a request with an early April purchase date. It turns out I bought mine on the 16-th, so there's no problem. I'm a little disappointed that HRO didn't let me know of the bonus. While they could have been unaware of it on the 16-th, they have my purchase in their computer and could have done a quick search when they were notified of the bonus to catch me and others like me.

There are similar bonuses on other Standard HT purchases, See the HRO ad in the June QST or the Standard ad in the May QST.

Well I would like to know if anyone has had bad or good experience with
a certain model hand-held. This is for a person that is just starting
out in the ham realms.

Radio Shack's HTX-202 VHF-FM 2-Meter Hand Held

What is the average range you have had with this model? Is it easy to use,
(i.e. program, button size)? Any complaints, what would you change?
How is the sound quality (both Tx and Rx)? How is the reliability? How
about the accessories, any good (Mic and Mag Mount Ant)?

Let me know your true feeling about the unit, here or by private reply.

Thanks to all in advance for your help, it is greatly appreciated!

I sold a microphone who can work with approximatly the totality of
HF transceivers.

This is a : ZETAGI MB+5 (made in Italy).

Caracteristics : Pre-amp. + dynamic compressor (+35 Db)
Ceramic type
Vu-meter
2 faders : 1 for Volume, 1 for Bass/Treble amount
power supply by a 9Volts battery.
Good HF grounded

This microphone is new (1 month old), cabling now for PRESIDENT LINCOLN
Sale with original pack and user manual.

PRICE : 250 FF or best offer.

REM : I can sale it out of France.

TNX.

********For Sale*******
****AOR2800 Scanner****
Wife says I have to many toys, So, I must say
goodbye to some of it for cash. (I guess she
wants to spend some of our money too!) :)

This scanner was purchaced from Ace Communications
1 year ago, for $449.00 plus shipping. It is in
mint condition, and has everything it came with,
except the box. (Wasn't that great of a box anyway!)
Selling price: $325.00, I pay shipping.
Terms: Money Order or Cashiers check ships same day
Personal check must clear first. No COD.

Trades: May be interested in NEWER computer periphials
or components (NO 8088, 286, or 386SX16 junk please!)
All mode TNC, Misc. Ham gear (Keyers, paddles, Antennas
etc.) These may be partial trades with cash, or full.

Features:

AM, NFM, WFM, SSB w/BFO
Coverage; 500KHz-600MHz 800MHz-1300MHz
Sensitivity: .35uV Narrow FM
1.0uV Wide FM
1.0uV AM

Step Increments; 5-995KHz

1000 Memory Channels
1000 Search Channels

This unit works flawlessly, and is guaranteed against DOA
Does HF Ham bands and SW Great! (If you are wondering why
the cut-out between 600MHz and 800MHz, it is to prevent
front end overload from strong TV stations, which is the
only thing you mis by not having those frequencies)
Comes with manual, Antenna, Power supply and a nifty acrylic
desk stand, and a cigarette lighter plug.

If interested, send E-Mail to ronh@pacifier.rain.com

From: sean@g0oanint.demon.co.uk
Message-ID: <30@g0oanint.demon.co.uk>
Source record: 226367

Hello All,

Can anyone tell me if the Yaesu FIF-232 interface uses or does
anything with the A.G.C. line on the C.A.T. output from their rigs ?

IE, does it do any kind of A/D conversion on the A.G.C. line that will allow
you to send the data up the RS232 interface to a computer.

Or does it just pretend it's not there.

Regards, Sean.

Source record: 226370

To Yaesu FT-2200 owners,

I am having great difficulty in utilizing the auto-dial feature
that is listed on page 35 of the owners manual.

I have no problem entering my telephone number (7 digits) or
my speed dial number (3 digits).

The problem comes when I replay the stored digits. There is always
an EXTRA digit. I am therefore unable to excess our auto-patch using
the programmed auto-dail feature.

I and several other hams have entered and reentered numbers time and
time again with the same results. Regardless of the number of digits
entered, on replay there is always that extra digit.

Am I doing something wrong or is this a bug in the auto-dail feature
of the FT-2200? Any help and/or suggestions will be appreciated.

Have a nice day. :-)

I just acquired a Hallicrafters SB3 broadcast/SW receiver, and it is rather cute and fun to play with. The LO seems to be quite a bit out, however. Does anyone have a schematic to get me pointed in the right direction to re-align this box? Would be much appreciated!

It is really good for satellite work such as INMARSAT, SCPC or FLTSATCOM.
It is a bit lacking as a scanner, the HF selectivity is pretty bad
but it does have good sensitivity over the entire tuning range. It does
have three antenna inputs, one for HF, another for VHF/.UHF and the third
for microwave. This is a very good feature which allows three different
antennas to be connected to it concurrently.

No other scanner in that form factor has this feature to my knowledge.

No computer interface, 1khz is the tuning resolution, and it does not
support SSB or CW as previously noted.

I own 2 of them and would like to have a third if that is helpful.

Any general comments on the preferences among Kenwood,
Icom, Yaesu, Racal, and Motorola in terms of useability,
durability, reliability?

Very broad question I realize; no doubt there are R-wars,
like between Post and K&E slide rule lovers, HP and TI
calculators, PC and Mac computers, and (perhaps) Icom and
Yaesu lovers. But seriously, are there any significant
differences in the "ilities?"

Different features and implementations, perhaps, but hard
core differences?

TIA, Andy La Varre

I bought one in about 1971. It was a decent barebones rig. It was made by
Yaesu (I think) and was sold in other parts of the world as a FT-200.
There was no provision for CW filters (that I know of) so some kind of
external filtering might be required if you use CW a lot. It uses a
external power supply, which I assume you get with the radio? If it works
$60 will get you a nice little rig.

>advance for your thoughts on this radio.

The Tempo One was my first rig. I bought it abt 2 yrs ago for $225 (a little too much). I had great fun with it on SSB and CW but it does not have all the bells and whistles you might need. I found the noise filtering to be the biggest problem. I sold it for $175 and bought a Kenwood TS830
Now Im a happy camper.

: I found a couple of companies which will sometimes have such old tubes,
: and one company that will rebuild old CRTs if they can get the electron
: gun for it, but so far nothing has panned out.

Kieth, I have a desperate measure of absolutely last resort which has
worked for me on several occasions with vacuum tubes.
While restoring an old Dumont oscilloscope (is there any other
kind?) I discovered that the serial filament chain pixie had struck
again - and that the culprit was a very rare and expensive ballast
tube. The break in the filament was visible. Figuring I had nothing
to lose, I applied power to the filament leads with alligator clips
and, holding the tube upside down, tapped it so that the filament ends
touched and arc-welded together. Much to my amazement, this actually
worked - and the darn thing is STILL running. Talk about
jury-rigged... But, I didn't have to pay an arm and a leg for the
nearly unavailable tube, and the scope works. I treat it as if it's
an atomic bomb - I know it must be VERY fragile...
I never thought this would work, because of the severe thermal
and physical stresses encountered in filament operation... but hey,
the proof's in the pudding!

>(specifically with respect to the R100)?

I think this scanner is not that popular because of its price/features ratio. The specs on this unit are great, but HF coverage without SSB is of limited interest to many. So we are really left with a VHF/UHF scanner. But the R100 isn't much of a scanner, its more of a comm receiver. Programming is typical Icom - lots of button pushing for simple operations. If I remember correctly there are no "banks" of channels, which is standard now for scanners. If you want a small comm receiver, that can scan in a pinch, then this unit is great. But most people opt to spend more and get the "He-Man" R7100. I have been tempted to get one several times, but I just don't know what I would use it for. Listening to satellites while mobile?

I like mine a lot too, BUT the cw narrow filter is a bit too ringy for
my tastes. The standard cw filter width is ok though. If being a human
modem is for you then get a better filter for this rig :>)

Earlier this week I posted the following to rec.radio.scanner and rec.radio.amateur.equipment:

I have a friend who is interested in the Icom R100. If you have experience with this radio, he'd appreciate hearing your comments (both pro and con) as well as alternative suggestions. Pointers to anyplace where discussions about the R100 might be archived would also be useful. I'll forward replies.

Well, either nobody feels very strongly about this radio, or all of you R100 owners (or former owners) assumed that somebody else would answer. The only substantive reply I got was from Richard Crisp. (Thank you Richard).

So this is a second attempt. I'll also add that I seem to remember that there was a series of several Icom wideband receivers (possibly including the R1 and the R100) which were not too well received (no pun intended). I recall hearing about problems with important characteristics like selectivity. Is there any truth to this (specifically with respect to the R100)?

I have a R100 that I am happy with. I bought it as a Genl
Purpose VHF Rcvr. Despite its wide range (.15-1800 MHz) mine has
been pretty intermod resistant (especially for an urban location).
I find the programming system pretty easy to use, for someone
like me who only occaisonally tampers with it.

My only regret is that it doesn't have an IF output which I
wanted for VHF WEFAX satellites (different bandwidth). I think
the Kenwood has that, but the wideness in the Kenwood also
hurts the intermod.

Hope my opinions help.

I agree with what Brent said. I own two of them. I find they are lacking for mobile use because they do not have a high powered audio amp which is necessary to overcome the high ambient noise environment of a moving car.

I use mine for satellite work at home and also for scanning a limited number of police freqs. I have no complaints regarding the performance of the unit. I do wish they would have programmed the unit a bit differently to make it a bit friendlier to use. But they work very well as a comm receiver. They work OK as a scanner.

In a pinch they will do OK on shortwave, but have no SSB and if you decide to mod it to add SSB, be advised that you need to provide some means to tune it to a finer resolution than 1KHz (pull the local oscillator a bit?) in order to get acceptable results (remember that maritime stations can be on 0.5KHz boundaries).

Another quirk is the lack of a line level output (useful for taping or RTTY, not that RTTY matters since there is no BFO!).

But it is a good comm receiver for sure.

I have access to a Motorola T45VGJ5G00AA Syntor trunking radio. I don't know much about trunking systems, but I'm told that the radio is synthesized and would require modification of the eprom to move it from where it is.

Is this something that is doable? Has anyone done this change to move it from the 850 band to our 902-928 freqs? Is information readily available, or not at all? In short, is this radio worth messing with? If it is, I would like to put it on the air and build either a high speed link for packet, or a repeater.

Any information would be useful.

Thanks and 73,
Gary

Source record: 226305
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna,rec.radio.amateur.swap

I'm looking for an old rotor (model HAM-M) made by Cornell-Dubilier Electronics (rotor division) once of Fuquay Springs, North Carolina. The original was from ~1968 and the company has moved or ceased to exist. I'd appreciate any information about where they are now (if they are) or about a mechanically compatible replacement. Electrical compatibility is not particularly important. (The reason mechanical compatibility is important is that the rotor was mounted using their custom bottom plated rather than a pole. The plate is well attached to the tower, and the whole thing is well weathered. Using a different style of mounting looks like major work. :)

Thanks,
Dan Lanciani
ddl@harvard.*

I have no problems using the speaker out jack and using a "line level to
recorder level" attenuator to record with my boom box.

To avoid the problems of switching between speaker and recorder, I have
put the two together so I can record and listen on my speaker at the
same time (or record and turn off my speaker with a switch)

PRIORITY LEVELS

This report has been prompted in part by a document distributed by NASA titled "Information on NASA Re-photographing the Cydonia Region of Mars" and letters written in January and October 1992 by Dr Michael Malin, NASA Mars Observer Camera Principal Investigator, and Mark A. Pine, Chief of the Policy and Plans Branch of the NASA Office of Space Science and Applications (references 8, 9 and 11).

Dr. Malin's letter indicates that the Cydonia region of Mars where the AOC landforms are located, was targeted for high-resolution photography as part of a general plan to secure images of scientifically interesting natural geological formations. However, the AOC hypothesis played no significant role in the prioritizing of NASA objectives. This position is

NASA'S POSSIBLE MOTIVATION

In 1960, a report titled "Proposed studies on the implications of peaceful space activities for human affairs" was delivered to the chairman of NASA's Committee on Long-Range Studies. The report was prepared under contract to NASA by the Brookings Institute, Washington, DC. The report outlines the need to investigate the possible social consequences of an extraterrestrial discovery and to consider whether a discovery should be "kept from the public" in order to avoid political change and a possible "devastating" effect on scientists themselves - due to the discovery that many of their own cherished theories could be at risk.

The concept of withholding information on a possible extraterrestrial discovery conflicts with an understood NASA policy to the effect that information on a verified discovery of

RECOMENDATIONS

Given the importance of the subject and the urgent need to take action, I have put forward the following recommendations. These recommendations apply to the Mars Observer mission in the event the spacecraft is recovered, and to any future missions, including a mission specifically to replace the Mars Observer.

* Assuming Mars Observer is not recovered, NASA will select a spacecraft carrying instrumentation capable of achieving high-resolution imaging of the Martian surface at least superior to that of the Viking missions of 1976, and having the highest degree of camera flexibility possible, including pointing capability.

* NASA and any private contractor who may be involved in imaging, by agreement, will assign a level of priority to the suspect landforms that will ensure the obtaining of high-resolution photographs of these landforms, using all means

>Can anyone advise me if can add scrambling feature in HF/SSB tranceiver?
>The radio will be used oversea, so should have no legal problem with
>FCC.

Most low end scramblers intended for telephones just do a simple frequency inversion of the voice. This isn't effective on SSB because people can just flip to the other sideband to receive the voice in the clear. Works OK on AM and FM though. There are more expensive scramblers that invert segments of the voice bandwidth individually, and also shuffle the order. These are somewhat effective, but a skilled listener can still understand a surprising amount of the speech. For really secure scrambling, you need to take a digital approach, and that's quite expensive, and unsuited to amateur grade HF SSB radios. The military has these, but civilian availability ranges from quite limited to non-existant.

For best security on HF, it's probably better to encode the message rather than attempting to encypher the voice. As far as I know, both codes and cyphers are illegal for amateur use worldwide, so this isn't just an FCC issue. However, codes may be legal on commercial channels in numerous jurisdictions. Confirm legality with local officials before transmitting, or you could wind up against a wall facing a firing squad in some areas.

Yep, that's basically what I do. I just wish they had provided
a line out.

>To avoid the problems of switching between speaker and recorder, I have
>put the two together so I can record and listen on my speaker at the
>same time (or record and turn off my speaker with a switch)

I find it annoying to use the speaker out line for recording
because I do not like the volume control on the radio to affect the
recorded level. Usually line out levels are fixed to allow recording
to be unaffected by volume control changes.

2192. IC-2SRA vs. FT-530

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-12 21:40:01 UTC
From: Mike.Holl@launchpad.unc.edu
Message-ID: <2tfvbh$aj9@samba.oit.unc.edu>
Source record: 226304
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner

Hello!

I need some advice...

I currently have ~$500 of spending money with which I'd like to purchase an HT. Considering that I don't have a scanner yet, either, and the fact that scanners which can receive cellular frequencies are dwindling fast, I'd like to pick up a transciever with a scanner built-in. (Not to listen to cellular, mind you. I would _never_ do that...)

I had been planning to purchase an Icom 2SRA, but was recently told that the Yeasu FT-530 also covers many of the same frequencies, with a keyboard mod. Considering that they are comparably priced, but that the 530 is a dual-bander, it sounds like a much better deal to me.

A few questions:

Exactly what is the mod for the 530, and which frequencies can be received? Is the sensitivity as good as the 2SRA? Can it receive WFM signals, as well?

I live in south-suburban Chicago... Is the 440 band really _that_ important? i.e. what does the 440 band have that 2M doesn't?

I've been told that Icom's are very difficult to use... Is this really the case? Is the Yeasu much easier to use?

Where should I purchase ham equipment from? I can't seem to find a dealer in the area, so am planning on purchasing it from AES. Has anyone had any problems with them?

Any other advice would be greatly appreciated...

Tnx.

I just got my Kenwood 733 and need help setting it up so
I can use it as a REPEATER...

I want to control it via my Dual band HT also....

By the way what function is set when you press and HOLD "F"
(function button) and press "TONE" or "T.ALT" ????? All
I get is ON or OFF.....

Also what is the function whwn you press and HOLD "F" (1 sec)
and then press "MUTE" or "X" ???? it seems to lock the radio, and
add a decimal point at the 100 hz point....

Thanks

Consider Erickson (sp) Electronics in Chicago. I have no personal
experience with them, but if you want to buy local...

I wish I had gotten a dual bander with some wide-band rx instead of the
2SRA. Don't get a radio for the cellular capability-- myself and most of
the people to whom I've spoken who've listened to cellular have found
ourselves BORED after a week of it. Find someone with a radio that can
scan it and see if listening is exciting for you. Most calls are,
"Honey? I'm on the way home... I'll be home in 10 minutes." That is
IF the cell doesn't change mid-conversation.

: dual-bander, it sounds like a much better deal to me.

The ft-530 will recieve from 136-174 and 400-512Mhz. It will work in the
800-960Mhz band but it takes about -80dbm to open the squelch, its close
to -120dbm for the ham bands. When modified it will transmit from
136-174 and from 400-470Mhz. I've checked mine for spurious on a hp
spectrum analyzer when transmitting and found it to be cleaner than a virgin.

The only thing to be wary of is using an external antenna near a
pagin/repeater site - its no worse than any other dualbander for intermod.

> that scanners which can receive cellular frequencies are dwindling fast,
> I'd like to pick up a transciever with a scanner built-in. (Not to listen
> to cellular, mind you. I would _never_ do that...)

Then you won't care that the 530 has only 12.5kHz steps in the cellular range, nor that my Standard C558A outperforms my PRO-43 when I've done antenna testing in that range. (The Standard has 10kHz steps. The ICOM W21AT has 30kHz steps, but I've read that it's not very sensitive outside the ham bands. I have no hands on experience to verify this.)

mods can be found in pub/hamradio/mods/yaesu at oak.oakland.edu. I believe this mod involves removing a diode.

I don't know the answer to this, but it's good to ask. HT's, as a rule, do not have WFM. One exception is the 2SRA with its 2 antennae. I'm told that the WFM antenna is attached with an earphone type of plug and is not terribly secure.

>
> I live in south-suburban Chicago... Is the 440 band really _that_

I don't know Chicago. If it's like other populated areas, the answer may be
room for simplex operation after you've established contact on the repeater.

I have the 530 which I have done the mod on. The receive is 110-180,
300-500, and 800-900 narrow FM and AM. It is transmit capable on all of
the listed except 800-900. Its performance is at least comparable if not
better to my Realistic and Icom scanners. I would highly recommend it to you.

It might be entertaining to try to figure out how to hook up a STU-II through
an HF transceiver. But it sounds like a royal PITA to make it work right. The
radios and atmospherics would have to pretty closely mimic a telephone
connection if it is to work reliably.
{^_^}
(A STU-III is a crypto telephone which comes in two models, one for
"real" US use by embassies and military for "sorta" classified stuff
and the other is for "export" to those who "have a need for one" and
are parts of foreign governments etc etc. It is AWFULLY hard to get a
paid if you're merely a civilian.)

2202. Need source for 10.245 MHz crystal

From: harris.pander01@ic1d.harris.com
Message-ID: <harris.pander01.55.2DFC4FCD@ic1d.harris.com>
Source record: 226315

In the process of repairing an Icom IC-22S, I find that the 2nd LO crystal is bad. I would hope that the 10.7 MHz (1st IF) - 0.455 MHz (2nd IF) = 10.245 MHz (2nd LO) crystal is common enough that I won't have to have one custom-ground, for ~$10. Where can I find one of these, real cheap -- for a couple of bucks, maybe? (This fix-up project has run into a lot of money already! I suspect that lightning got the rig before I did...)

Thanks!

2205. Help with Antenna Rotator

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-13 17:58:21 UTC
From: dtiller@cscsun.rmc.edu
Message-ID: <CrCKLA.3Du@cscsun.rmc.edu>
Source record: 226318
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.antenna

I recently purchased a tower and VHF antenna system that happened to
come with a house :-) and I'd appreciate it if someone could give me a
hand figuring out the rotator. The previous owner left a control box,
but I don't think it's the correct one. By some clever sleuthing with
my ohm/inductance meter, I've found the following configuration 'up the
tower':

```
25mH 25 mH
Y/G --UUUUU---\/---UUUUU---WH/GY
/\
R/BK-------------/ \ 3 mH
| \--UUUUUU----V/BR
V
O --/\/\/\/\/\--BU
470 Ohm
```

Y/G = Yellow/Green; WH/GY = White/Gray; R/BK = Red/Black; V/BR = Violet/Brown;
O = Orange; BU = Blue

By the looks of it, there are 6 separate wires, with R/BK being ground,
V/BR being the brake, O/BL/R/BK the sense circuit, and Y/G ans WH/GY
being the actual rotator coils. The previous owner says he thinks it's
an alliance HAM IV rotator. Does the above schematic agree? What voltages/
current ratings does this rotator take? The box that was left has 8 outputs -
is it compatible, or is it to another type? (As I recall it says CDR on it -
also 'Cornell Dublier'). If it's not compatible, I'd like to make (a
computer controlled) one. I'm not up to climbing the silly thing (125 feet)
since I fell 'with' an improperly guyed tower some years ago and broke a bone
in my foot. The old courage just ain't the same :-)

Any help will be greatly appreciated, and thanks in advance,

2206. WANTED: Low RFI laptop

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-13 18:01:02 UTC
From: john.jewkes@tcfarm.com
Message-ID: <9406131201052490@tcfarm.com>
Source record: 226328

dear Scott,
I am afraid that almost all computers have at least some RFI tendencies. The newer/more powerful/faster the more RFI they have. They have had this problem every since they took and got through the 10 Mhz barrier for the coprocessor. Unfortunately, this is also the first IF frequency of just about every two-way and monitoring radio made since 1972.
The only cure I have found is to enclose the CPU in wood.
This cuts the RFI by about 45-50%. I have also heard that if you back off the receiver micro-voltage sensitivity, that this cuts back RFI as well. you of would leave (of course) ventilation in the enclosure.

The older tube style radios are not as vulnerable to RFI from computers. In larger cities, this is even more pronounced, as there are more computers, closer together, so RFI is even harder to avoid.!
good luck. 73 de KB7WTD...John in Gresham,Ore

2210. Poor Man's UHF Transmitter Combiner?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-13 19:02:19 UTC
From: jra@lawdept.daytonOH.ncr.com
Message-ID: <jra.180.000E0A4D@lawdept.daytonOH.ncr.com>
Source record: 226338
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I'm looking for a cheap way to combine two UHF repeaters onto a single duplexer and antenna system. We can't afford to buy a hybrid combiner/isolator system, so this is going to be homebrew city.

Assuming that we can put the new repeater on a channel close enough to be within the duplexer's passband, we need to come up with a way to inexpensively combine two 35 watt UHF transmitters.

I think we can come up with several isolators, since UHF Micors have ferrite isolators in the T/R switch and there are lots of dead ones floating around. Our current thinking is along the lines of using two isolators in series on each transmitter, which should give, what, 40 or 50 dB of isolation? And the Micor isolators have a 50 watt or so dummy load on the reverse port, so I hope they can handle the power.

Then, a Wilkinson combiner made out of quarter wave sections and a 100 ohm noninductive resistor would provide some additional isolation and provide an impedance match into the duplexer.

The transmitters will be 35 watt Mitreks, and we can afford to lose 3dB in the resistors if we have to. The important things are a) not to fry the transmitters, and b) not to generate intermod.

Does this seem like a sensible approach? Is there any other way to do this? Our budget could handle a couple of hundred bucks, but unless we can find a very cheap used combiner, it doesn't look like the commercial solutions are possible for us.

Thanks for any thoughts on this...

I am getting a Chevrolet Lumina (1993) and intend to install my dual-band mobile rig. This car has alot of computer controlled systems and I don't want to interfere with them. Also, although I haven't really spent a whole lot of time looking, I don't seem to be able to find anyway of running the power cables through the firewall. Will I have to drill a hole and put in my own grommet?

I plan to put the antenna on the trunk. Any suggestions on the best path to run the feedline through?

I am hoping that I may be able to benefit from the experiences of other Lumina owners. Any information regarding this installation in this vehicle will be greatly appreciated. Please e-mail responses to save bandwidth on the net.

Thanks
Mark

$500 is a fair price if it includes the power supply and the radio is in
good shape.

The TR-7 has performance comparable to the best of the currently-available
radios, but without the bells and whistles. It is all solid-state and has
digital readout, but the synthesizer inner loop is obtained from a PTO
(permeability-tuned oscillator) rather than being fully synthesized, so the
stability is not quite as good as modern rigs. (Although the Drake PTO
is one of the most stable tuned oscillators available in amateur gear.)

On the other hand, the Drake synthesizer approach does result in excellent
phase noise for a synthesized radio. Better, I believe, than most radios
available today.

While Drake is no longer in the amateur radio market, they are still in
business and still service and support all their old products.

I have been trying to give this away for some time now. Perhaps
someone will take it off my hands this time.

I have the following INSTRUCTION/OPERATORS MANUAL up for grabs:

HY-GAIN THUNDERBIRD (TH3Mk30 THREE ELEMENT HAM ANTENNA.

This INSTRUCTION/OPERATORS MANUAL is in good condition.

The intent is to give this INSTRUCTION/OPERATOR MANUAL to an
individual or entity who ACTUALLY has the equipment.

The first person to send me e-mail and follow up with a large manila
SASE with postage for 3 ounces gets the prise.

If you are the lucky one, you will be asked to send a SASE (large
manila or other envelope) with the appropriate amount of U.S. postage
to me c/o the address in my .sig file.

Also, as a courtesy, a photocopy of the manual will be sent to anyone
else who sends me a SASE.

Good luck to one and all.

73,

~jack_

V
O --/\/\/\/\/\--BU
470 Ohm
```

Y/G = Yellow/Green; WH/GY = White/Gray; R/BK = Red/Black; V/BR = Violet/Brown;
O = Orange; BU = Blue

By the looks of it, there are 6 separate wires, with R/BK being ground,
V/BR being the brake, O/BL/R/BK the sense circuit, and Y/G ans WH/GY
being the actual rotator coils.

To make the motor spin, we used 12vac connected as follows:

ac1 to R/BK (common)

ac2 to Y/G (coil 1)

ac2 through 50uf non pol cap to WH/GY (coil 2)

to reverse direction just switch which coil gets the cap.

I have seen several of these motors, and all have operated on the same principle
of phase lead/lag to make it spin.

I would expect that nearly any rotator would work it provided that the voltage
was same. I have seen a rotor box that had a 24v filament type transformer that
powered it.

Hope this info is of use.

2218. TH-78A Peculiarities <--Help Wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-13 22:23:08 UTC
From: mrw13@namaste.cc.columbia.edu
Message-ID: <2tim8c$87s@apakabar.cc.columbia.edu>
Source record: 226326
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I had the "beyonds MARS" (remove D3 and cut W1) done to my TH-78A and everything works pretty well except for a few peculiarities... When I set both sides (VFOs) to VHF the right one acts strangely. The rx is far more sensitive then the left side because the squelch will open often times on the right side and the meter will go up while I'm not receiving anything on the left side. But... even though the right side has better rx I cannot hear any of it because it comes out as barely understandable static. (When I am close enough I can get perfect rx on the left side.)

There is no difference around the 440MHz band. I haven't been able to check whther these "peculiarities" also occur around the 2m ham bands since I'm not close to any repeaters right now -- but it definitely holds true for the aircraft and commercial bands.

One other small thing. About half the time, the tx doesn't always open up immediately on the commercial band. The red light will flash on and the meter will jump up but then drop down after a split second. After fiddling (switching channels or turning the radio on-off) then it will tx properly. Never any problems tx on the ham bands.

Anybody else noticed the same peculiarities or have any advice for me?

Thanks very much,

Marc Wollemborg

I bought one of these things last month and I have it in a very strange state. When I press UHF both the uhf and vhf receiver work. when I press VHF i get no sound from vhf receiver but uhf receiver will monitor the frequency it was last set to. I assume that my problem is "pilot error" rather than a problem. How can I get the radio to operate independantly? The instructions are useless. Thanx in advance.

Keywordse

I am very interested in getting started in amateur radio;
however, I do not understand alot of the terminalogy or some of the
equipment used in amateur radio. I do have a electrical tech. degree so
I do understand electronics and electronic theorys. Also I am a service
tech for a security alarm company. I would like to know how to get
started. I have seen some books for sale in Tucker Electronics and
Universal Radio which explain some of the equipment used. Could someone
please E-mail some info so that I can get the ball rolling.
I am also interested in scanners and I am in the process of
trying to decide on which unit I should purchase. I currently have a
bearcat 200xlt which is fine for my job or at the race track; however, it
is a limited unit even if I modify it. I like mtv7100 or the Icom R1.
Does anyone have any sugestions on these units or any other scanner.

Thanks for the info
Sam Prynda

I am loking for the schematichs diagram and the component view of
the 2 meter RTX named IC02E from ICOM.

It is a 1974 (I guess) 2 meters RTX.

The problem is in the receive section.
Basically it is ok but it need 10 microVolt at the antenna input
in order to receive something.
It should usually be 0.5 microVolt .
I checked this with a R.F. signal gererator.

I do not know if it has an RX preamplifier or what else that can went
bad.

I will really appreciate the schematics but even hits.

please email me at robertov@hqlab.ico.olivetti.com

If anybody is so kind to send me xerox of schematichs and eventualy
components view i can refund his/her money if he/she want to.

It will cost you one dollar for the letter

2226. Re: European vs American Radios

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-14 12:49:25 UTC
From: mvermeer@cisco.com
Message-ID: <2tk90l$fvg@cronkite.cisco.com>
Source record: 226339

I know of some differences between the american and european versions of the Kenwood gear (but some of it is probably applicable to other manufacturers):

- The american versions do not have 1750Hz tone for activating repeaters. The 1750 tone module can be installed afterwards.

- The european 2m band is 144-146, the american is 144-148.

- The european models cannot be configured as repeater (without internal modifications).

An 'american model' can be changed to an 'european model' by changing some straps (or did you think that they where really different in their hardware).

hope this helps,

Marc, on1amv.

-What is an ICOM 229H 2 M rig? FM, SSB? AC or DC?

The 229H is a 2 meter mobile, 50 Watt rig. Runs on 13.8V ~10A at hi power
(it has 4 power levels). It will RX from 138-172 or thereabouts (can't
remember if it does aircraft) and it can be hacked for extended TX for
MARS or CAP. It's a nice little rig for both mobile and home use.

>combine two 35 watt UHF transmitters.

You could also pick a frequency that's over 1 MHz away from the opposing
transmitter and combine them with notch cavities and circulators. The method
you've described could be done easily. Wilkinson power dividers and isolators
(make sure you use two isolators per port) will do quite nicely. Measure
the heck out of it after you put it together to make sure there are no intermod
problems. This is essentially how the commercial guys do it.

I've successfully combined two duplex stations on a single antenna, but one
was 440 MHz and the other was 420 MHz. It was actually pretty simple. If
you're interested, I'll drop you a copy of the diagram on it.

> opinions on if it is worth the 5 bills.

Darn fine radio in it's day (1980ish), but unless it is in mint
condition, $500 is on the edge of getting a little high.

It is very good on SSB, CW, and RTTY. The receiver is fairly
sensitive and low noise, although not quite so hot on 10 meters.
There was no RF stage, and the first time I used it, I cranked
the gain because it was so quite. When I tuned across the first
signal I came to, it was so loud it darn near broke my
headphones.

It was triple conversion with the first IF at 40 mhz. The IF
filters were SHARP and smooth. There was front panel passband
tuning on receive and under the hood bandpass tuning on transmit
to adjust for oddball RTTY AFSK tones and to match SSB audio to
the user's voice.

The Drake noise blanker was exceptional, but even without it I
was able to run HF mobile with negligible ignition noise.

The final protection scheme was very good. Rather than wait
until it sensed trouble and then try to turn you off in time to
avoid damage, it would not let you come all the way up to full
power until after it decided it liked the load it saw. With a
fan, it has a 100% RTTY duty cycle.

The VFO was analog with a digital counnter with 100 hz
resolution. The frequency control scheme was a little unusual,
but very effective. It was general coverage receive and non-WARC
hamband only on transmit, however the conversion to general
coverage transmit is an easy jumper snip and obviously what
Drake intended for use with their mil/gov customers. You need
Drake's extended frequency coverage board ONLY if you have some
need to use crystal control of the transmit frequency.

The output control enable you to turn output down to 1 watt or
less if you wanted to work locals or QRP.

All in all, it was a rugged, quality radio that was fun to use.
It would be a good beginner's rig. However, if you like modern
Japanese radios that make your coffee, wind up the cat, and put
out the clock, you might feel deprived.

2237. Re: WANTED: Low RFI laptop

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-14 22:23:23 UTC
From: Earl=Morse%EMC=Srvc%Eng=Hou@bangate.compaq.com
Message-ID: <77162900334n12@131.168.114.12>
Source record: 226146

> I am afraid that almost all computers have at least some RFI
>tendencies.

True.

>The newer/more powerful/faster the more RFI they have. They
>have had this problem every since they took and got through the 10 Mhz
>barrier for the coprocessor. Unfortunately, this is also the first IF
>frequency of just about every two-way and monitoring radio made since
>1972.

Not true! Laptops are no noisier now than 5 years ago. The FCC standard that they are tested to has maintained the same levels since then. In fact many manufacturers are testing to even more stringent European standards. Also while trying to conserve battery life emissions have been reduced because of the many low power consumption components used in them. Less power used, less power radiated.

> The only cure I have found is to enclose the CPU in wood.
>This cuts the RFI by about 45-50%. I have also heard that if you back
>off the receiver micro-voltage sensitivity, that this cuts back RFI as
>well. you of would leave (of course) ventilation in the enclosure.

I don't know about shielding with wood, I have never seen it tried at any of the EMC labs I have worked for or with. {;-)) You will find that most laptops already have some sort of shielding in them i.e. a metal plated cabinet, laminated foil shields, or stamped metal shields

>
> The older tube style radios are not as vulnerable to RFI from
>computers. In larger cities, this is even more pronounced, as there are
>more computers, closer together, so RFI is even harder to avoid.!

Probably not as vulnerable because they are less sensitive than today's radios, but probably more selective than today's synthesized DC to DAYLIGHT handhelds.

As for selecting a RFI quiet computer, there are a few things you can do but no guarantees.

Stick with larger well known manufacturers. These companies have the resources it takes to staff a department solely for measuring and reducing RFI in computers.

If possible try and determine if the company has their own FCC listed Open Field Test Site. A company that has at least one is going to care more about RFI problems.

Stay away from a buy sell operation. Though some of these may be made by a major manufacturer, most of them are made by small electronics companies in Asia that will eliminate anything they want from the design to save a buck. The RFI filtering is one of the first things to go, right after the FCC grant is received -- naturally.

Other things to stay away from are: the top of the product line because it may have some new high tech gbadgetry that will be noisier; the bottom of the line because chances are it is a low cost buy sell product.

If you are really interested in finding out which models are the quietest try getting in touch with the people who do the testing. There are labs across the country that do nothing but test and certify compliance to the FCC standards. They will probably tell you who is quietest, but in keeping their customers confidence they won't tell you who is noisy. Or contact the engineering group at the company whose product you are interested in. They would probably be happy to brag about which product they make that is quiet and let you know if the emissions are highest below 30 MHz or above it. Some companies might even give you data. Maybe! Some might say it is against company policy.

The company departments are usually called Regulatory Compliance, EMC Services, RFI, and are usually in the engineering department. They are sometimes paired up with a group called Product Safety that gets the Underwriters UL mark.

Like I said, -- No guarantees but I hope this helps. Good luck and I hope you find what you are looking for.

Hello everyone,

I'm a recently licenced tech class ham (still waiting for that ticket) and have purchased a Kenwood TH-22AT H.T. I would like to know if there are any mods available for it. Thanks!

-Paul
(please E_Mail replies, as I hardly ever get to read this group)

Greetings,

Looking for a boatanchor general coverage rx!
How about an R-388/51J3, R390(A), Hammarlund HQ-180, Hallicrafters SX-88,
SX-99, SX-100, TMC GRC-90, or (insert rx here)!?

Help me itch my boatanchor scratch! Any information leading to the discovery
and acquisition of such a beauty would be rewarded by my eternal gratitude, and
my girlfriend's scorn (she'd prefer that I'm not kept warm by OA2s and the like
when she is supposed to perform that function on cold winter nights-hi)!!

73s,
Chris, KA8WFC

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

The UTU was made in the early to mid 80's. It did CW/RTTY/AMTOR and during its last year, they had a packet option for it. This thing was replaced by the KAM.

R> My requirements in order of priority are loosely these : -

R> 1) Small-My Wife wants to be able to carry it in her purse
R>comfortably. 2) MODIFIABLE for the UK Tone Burst.
R> 3) Pager Function.
R> 4) Easy To use.
R> 5) Good Performance.
R> 6) Ease of use in the car.

Well, you didn't mention price, so I am assuming it's not that big of a factor. In that case, try the Yaesu Ft-530. It's got all the features you're looking for, and more. We have one, and have had no problem with it whatsoever. To use in the car, Yaesu makes a handheld mike with lcd display built in so you can velcro the radio under the seat and just have the mike within reach, while maintaining full control of the radio. Get yourself a good 5/8 wave vertical while you're at it..the gain will be worth the added size, especially when you're running only 5 watts. Oh yeah- to get the 5 watts on this HT (and most all other HT's), you should buy a power cord that plugs in to the top of the rig...hardwire it in to your car. Anyhow, the local shop has been shoveling these radios out the door so I imagine you can't go wrong with it.

Message-ID: <CrFxw1.J33@tc.fluke.COM>
Source record: 226157

If this question has been asked recently, please excuse my lack of attention.

Question: Does anyone have any experience with 'Periphex' or any of the other after market Ni-Cad battery packs for HT's? They are about half the price of the radio manufacturer's packs and that's hard to ignore unless the 'you get what you pay for' rule applies here?

Any experience or recommendations, comments, or advice would be appreciated.

Thanks,

GL+part of Alaska. He was told that he needed a handheld Aircraft band
+receiver. Does anyone make a handheld that would operate on the aircraft
+band as well as the marine or one of the ham bands? Can a modifcation

All the Jap mfgrs make such talkies. The Alinco DJ-580 for example
covers the AM aircraft band (but will not xmit AM), 136-174 Mhz or so
for 2 meters (xmits anywhere in the range on FM) and 379-480 Mhz
(approximatly) for 440 coverage (also will transmit entire range on FM)
plus 800-989 Mhz receive only. Mod is simply cliping two wires.

No, Icom doesn't make portable or mobile all modes anymore, just desktop units. The desktops are fine rigs though, and if you've got a *big* dashboard, say a 57 Chevy, you could use them mobile.

The old portables were the IC202 and IC402, and the mobile was the IC245. They can still be found from time to time at hamfests. Yaesu still makes battery portables for 2 meters and 70 cm.

> are parts of foreign governments etc etc. It is AWFULLY hard to get a
> paid if you're merely a civilian.)

Let's put some kind of magnitude to "royal PITA" for this interface. You need to first find a way to run 14.4 kB across an SSB channel, complete with HF fading, with a bit error rate of 10^ -5 or so. Many hams would LOVE to see this so they could improve the domestic HF packet forwarding network throughput and delivery response time, so you become an instant ham-hero.

That done, you can now couple in the STU. But the questioner stated that this is for commercial use in a foreign country, and the STU units are considered as "Munitions" by the U. S. State Dept. Thus he's not going to have any great opportunity to put his hands on one in the near future.

Comply with the FCC rules governing your commercail and amateur licenses.
Don't try to use a radio which is not type-accepted on the commercial
bands. It's illegal, and as you can see the rig wasn't designed to operate
there. You may THINK that it is eventually operating correctly, but when
you stretch the PLL that far the units become extremely noisy and put out
some horrendous spurs in places you don't want to be found. The FCC rules
are there for a reason; if you are on the "commercial" band taking in
money, spend some of it for a proper and legal radio unit before the FCC
puts your amateur license in jeopardy.

Ok, I'm hoping this is the right group to ask. I've asked a few and
only gotten information about commercial downlink providers.
I saw a tv show not long ago with a guy sailing across some ocean in
a reed raft and the only comm link he had was a laptop with a small
(hand held) sat dish .... I'd like to know what equipment is required
and any other relevant information .... licenses, comercial providers
contact information ... etc. As always thanks in advance and please
respond by email,
Ken

2257. *sigh* I admit it - TM-941 mods needed

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-15 20:50:05 UTC
From: obrien@Aero.org
Message-ID: <2tnpht$shc@news.aero.org>
Source record: 226165

After years of just not bothering, I find I now need to make my TM-941
tri-bander start operating as a crossband repeater (out in the boonies -
where urban interference won't lock it up!).

The regular mod sites don't seem to have this; just out of band transmit.
A little session with 'archie' failed to turn up any other candidates.
I dimly recall seeing this mod years ago; if memory serves, the out-of-band
transmit mod is a prerequisite to this one.

So - how do you get a 941 to turn into a crossband repeater, please?

2258. WANTED: ICOM IC-970H

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-15 21:22:31 UTC
From: terry@venus.sunquest.com
Message-ID: <2tnren$l17@venus.sunquest.com>
Source record: 226167

I'd sort of like to get an ICOM IC-970H, mostly for its capabilities as an all-mode dual-band (2m/70cm) base station rig. Of course, it would also be a nice rig for satellite comm, should I ever get some time to become interested in it ...

But the list price of $3900 or so kind of puts it beyond the reach of a casual purchase, even with the current ICOM $250 discount.

Could someone please advise me of

1) what a fair used-market price for this unit would be, in very-good to excellent condition

2) where one might go to obtain this unit at approximately the price quoted in (1) above

AdTHANKSvance for any info.

I have a car CD player that is like new for sale. Optimus by Radio Shack. It is a single CD underdash or indash unit that has a built-in amp (36 W) or can go directly to an amp from its' pre-amp outputs. It doesn't skip, (I had it in a rough riding Toyota Celica) and I'm selling it so that I can buy a 10 CD unit.

$100.00 or best offer.

Rich(412) 824-8959 or E-mail me.

2261. "Intrinsically safe"?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-16 01:52:24 UTC
From: alavarre@ids.net
Message-ID: <2tof1u$24h@paperboy.ids.net>
Source record: 226166
Cross-posted to: rec.radio.amateur.equipment,comp.dcom.telecom.tech

What does the term "intrinsically safe" refer to? Electrical safety? Spark ignition safety? Security capabilities?

We are reviewing several VHF portables, some of which claim to be "intrinsically safe" in the context of MIL-STD 810C/D and with reference to DTMF encoders.

The term is used as a feature *in addition to* MILSTD 810 compliance, the latter being shake, rattle, and roll standards. That implies that the term refers to some sort of physical safety, while its use in conjuction with scramblers & encoders implies some sort of security level...

In particular, these cite
Class I, II, III, Division 1 Groups C,D,E,F, & G, Nonincentive
class I, Division 1, Groups C&D

From: feustel@netcom.com
Message-ID: <feustelCrHKw3.6DG@netcom.com>
Source record: 226188

I just started using Millenium rechargable NiCad batteries instead of regular alkalines. The Milleniums last only a day after 3-hour quick charge while the alkalines seem to last for at least a week before dying. My experience makes me wonder about the relative run times for alkalines, recharable alkalines and NiCads? Doas anyone have any data on this? Thanks.

Usually, it means that if used in an explosive atmosphere, such
as fuel / oil refining, mining, etc, the radio is safe to use.
Operating switch contacts, etc. are contained in a gasetight
seal.

RE: Touchtone pad - each key makes a contact closure. Some
keypads, added at the dealer after the radio is amnufactured,
don't meet the spec, although th erest of th eradio does.
So aparently in this case, the radio _and_ the DTMF pad
meet the specification.

>Spark ignition safety? Security capabilities?

IS means the system has been designed to not make sparks that might
ignite the atmosphere you are it. I.e. -- you can use it where there
are {gasoline} fumes, etc.

This is done with what amounts to current-limiting -- if you have very
little available current, it can't go boom.

>In particular, these cite
> Class I, II, III, Division 1 Groups C,D,E,F, & G, Nonincentive
> class I, Division 1, Groups C&D

These are catagories of Article 500 ofthe National Electric Code. I can
no longer remember the specifics, but one Class/Group is for gasoline
fumes, another for hydrogen, etc...

2270. Aftermarket Batteries

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-16 14:05:00 UTC
From: HICKS.ALAN@epamail.epa.GOV
Message-ID: <01HDLUIWVNRA8ZNW89@mr.rtpnc.epa.gov>
Source record: 226195

******Ron Borst asked about after-market replacement NiCd batteries***

I have purchased and installed "inserts" for ICOM BP-5 batteries from TNR and been very pleased with the results. Several dealers including TNR also offer variations of the standard battery packs, including shells that can be loaded with standard AA NiCds. I suspect that TNR, Periphex and W&W are all pretty good sources for these things. If you look inside your battery pack from ICOM, Yaesu, Kenwood, etc. you'll find the same kinds of generic NiCds that you're going to get from the aftermarket sources. You just don't pay for the name.

(My opinion only, of course)

Two comments:

(1) Alkalines last longer than NiCads, by *some* multiple which will vary
according to brands of batteries and application.

(2) In my experience with AAAs, Milleniums last noticeably less than
Panasonics, GEs, or DynaCharge's.

>considered as "Munitions" by the U. S. State Dept. Thus he's not going to
>have any great opportunity to put his hands on one in the near future.
>
>
You're probably correct in saying it would be quite a "PITA". If it were
easy to do, then the military would be doing it, rather than the more
esoteric gear that's in use now, given the cost of an off-the-shelf AT&T or
Motorola STU III is probably less than STANAG HF voice encryption.

Try Transcrypt or some similar type outfit. Commercial anaglogue voice
scrambling is considerably easier to implement on HF than secure encryption.

I believe that intrinsically safe refers to use of the radio in hazardous environments, such as around flammable liquids. I believe that the references are to the National Fire Protection Association standards, which take up about one foot on a bookshelf.

These opinions are my own, and not those of my employer.
Richard Ferguson

2279. Motorola Mitrek conversion question

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-16 19:53:40 UTC
From: benedict_m@bj.palmer.edu
Message-ID: <2tqak4$lkr@insosf1.infonet.net>
Source record: 226202

I am converting a Motorola Mitrek (UHF T44 series) to amateur service. Everything has gone well, its tuned up and on frequency, except that the receive channel element fails to start oscillating after you unkey the transmitter. If you just turn the radio on, the receiver works fine, key the mic, transmitter works fine, unkey the mic, receiver is dead. I ordered the xtals from JAN and installed them in the channel elements myself. Local hams have since told me that JAN xtals may be suspect, and that ICM is the preferred choice (I now have a duplicate pair of xtals on order from ICM at aprroximately twice the JAN cost). Oh, and if I put one of the original channel elements back in the receiver (with the commercial freq) the receiver operates just like it should.

Questions:
Anybody experience this type of problem before?

Any bad experiences with JAN xtals?

Theres another variable inductor on the receive channel element that is accessable only with the cover removed. It is horizontal and off to the side of the PC board as opposed to the verticle inductor thats at the top and puts the element on frequency. Anybody know what this adjustment does?

Possible bad channel element?

Random thoughts anyone?

73's & TIA,
Mike Benedict - KA9GSC

2280. Remember Kenwood TV-506/2 transverters?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-16 20:04:38 UTC
From: benedict_m@bj.palmer.edu
Message-ID: <2tqb8m$lkr@insosf1.infonet.net>
Source record: 226203

I have a Kenwood TV-506 six meter transverter that I'm dieing to play with. The problem is that I don't have the interconnect cable that goes between the transverter and the TS-520. Local sources have been unable to identify the type of connector Kenwood used and Kenwood themselves no longer have the information. If somebody could give me a part number or manufacturer of the connector, I would greatly appreciate it. I'd also be interested in purchasing one, if somebody happens to have one around (or a dead or alive transverter too). Anybody remember ever using one of these transverters?

73's & TIA,
Mike Benedict - KA9GSC

2281. Kudos to AEA on PK-232/TS-450 Interface

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-16 20:20:44 UTC
From: kriss@austin.lockheed.com
Message-ID: <2tqc6s$3o6@kestrel.austin.lockheed.com>
Source record: 226204

Ref: My (kd5vu) posting "Wimpy AFSK Output TS-450S"

First, the problem is HISTORY and the TS-450 and PK-232 are working great.

The following are my notes on how to interface a PK-232MBX to a TS-450S/AT
for FSK Operation. These notes are based on tips and notes from Richard
Stuart, WF7A, from AEA. Richard really helped and I appreciate AEA's
technical support to old customers as well as new customers. BUY AEA products!

You need two wires from the PK-232 (from J7 and J7) to one ACCY2
port on the TS-450S/AT. The following are the connections:

PK-232MBX to TS-450S via ACC-2 Connector for FSK

PK-232 (J-6) TS-450S/AT (ACCY-2)
============ ============
Pin 5 RED PTT Pin 9 PTT
Pin 4 BROWN GND Pin 8 GND
Pin 3 BLACK - Not Used
Pin 2 WHITE AFSK-OUT Not Used
Pin 1 GREEN AFSK-IN Pin 3 AFSK-OUT
Shield Pin 12 GND

PK-232 (J-7) TS-450S/AT (ACCY-2)
============ ============
Pin 4 FSK-R Pin 2 RKT
Pin 2 GND Pin 12 (shield)

Forget about even trying to run the TS-450 in AFSK. Go FSK
and you will not have problems. The TS-450 is hosed for AFSK.
Don't waste your time or money on a phone call to Kenwood for help.

If you have a TS-450, I suggest you SAVE this message.

Dick Kriss, KD5VU

BD> independantly? The instructions are useless. Thanx in advance.
BD> Brian
BD> KC2RM
With the radio off, reset it by holding down the function button (the
button just above the press-to-talk on the left side), and turn on
the power. This puts it back the way it came from the factory. This
proceedure wipes all memories, including the ones you FINALLY got
stored in the thing. BTW the manual isn't very good but careful study
WILL reveal all.

Companies that offer add-on boxes include:

Crypto-AG
Datotek
TCC

As mentioned, you find that you'll need "special paperwork" to buy this
stuff.

As for high data rates over HF....

There's 16 tone and 39 tone parallel tone modems for this that do
2400 bps with FEC. At that data rate, it'll have little error
protection.

Current Serial tone technology is up to 4800 and perhaps even 9600.
Again at that rate, little error control.

There's few manufacturers of this stuff....

Fredericks, Harris and Collins come to mind.... at about $10K a pop.

Err, Dave, you need a dictionary. :-) Munitions are not just ordnance --
guns and explosives -- the term covers all military or war supplies.
Encryption devices do certainly belong there. I'm sure you've heard the
stories of how the Allies cracked Enigma and Code Purple during WWII...

Intrinsic safety is related to the chance that an electrical or electronic device can initiate an explosion in a flammable atmosphere. Div 1 has the explosive atmosphere present at all times. Intrinsic safety requires that two improbable failures occur before ignition energy is present. Div 2 has the explosive atmosphere present only as the result of an improbable event. So, only one improbable failure failure is required for an explosion. This is called the non-incendive category. In either case, two improbable events are required to ignite an explosive atmosphere. The Classes refer to vapor, dust, and other mixtures in air.

I hope this helps, but it is just a personal opinion. Don't bet your company's future on these statements.

Bill

14.4K? Whazzat - we're running STU-IIIs at 4800bps on Standard M terminals.
The voice quality is nothing to write home about. But it IS readable.

And I never said it'd be EASY to get the STU-IIIs. (Um, but it is not all
THAT hard to get DES encoder chips.... A trio of them with different keys
CAN provide very good security for many applications. Of course they too are
<cough> munitions. But as small as they are smuggling is easier I suspect.
Of course the Europeans and Asians have access to homegrown efforts.... The
hard part is the digital voice algorithms.

As War Materiel goes, bullets and communications stuff are in the same
category. Like the old phrase "you can outrun a police car, but not his
radio" goes... Reliable comms are as critical as bullets. So would we
randomly export bullets? (yeah, I know we do) So why not (try to) control
zoot comm stuff the same way. BTW, it's a pain for manufacturers.

As all have told you, most new handhelds receive in both the
Aircraft and Marine bands, and some transmit. Don't do transmit
on those bands using your ham handheld in the United States,
however. All transmitters for those bands (aircraft & marine)
MUST be FCC type accepted for use in those bands. To my knowledge,
no ham handheld is currenly accepted for use in the aircraft &
marine bands. Keep in mind that the type acceptance is for
transmitting only, you can listen all you want.

: >the one I have described in QST. I remember ICOM used to make 2M, 6M. and
: >70cm multi-mode portables. Do they still make similar radios?

: No, Icom doesn't make portable or mobile all modes anymore, just desktop
: units. The desktops are fine rigs though, and if you've got a *big* dashboard,
: say a 57 Chevy, you could use them mobile.

Icom claims their new IC-820 Dual band All mode radio is suitable for easy mounting in a vehicle (9.5W x 2.7H x 10 inch D). The IC-901 has a 2M SSB/CW module so that might also be a possibility (it has a remote control head hooked up with a fiber optic cable to the radio).

: The old portables were the IC202 and IC402, and the mobile was the IC245.
: They can still be found from time to time at hamfests. Yaesu still makes
: battery portables for 2 meters and 70 cm.

The IC-290 was another all mode designed for mobile work. I'm not sure of the IC-260. W1XX had one of these on his 2.3 GHz transverter. They put click-stops on the tuning dial for mobile work. I've never appreciated this feature when hunting around for other microwave stations....

I recently purchased an Icom 22s at a local hamfest. It is the model
that tunes 146-148
in 30 kc steps, it has a toggle switch for the 15kc steps. The seller
said that he added a new
switch from Icom which shows the actual frequencies rather than just the
22 diode programable channels. The rig works fine. Does his explanation
makes sense, is this really and Icom modification, or was it some after
market gismo? Finally is there a way to get down to the repeaters below
146 mhz. Thanks for the help 73 George

I'm expecting a package soon from W & W Associates, who also sell Ni-Cad packs and custom chargers. I wanted to shop Periphex, but they took two months to send me a catalog, and their prices aren't as good. Now that I have it, I'm surprised to see that they only resell Yaesu standard chargers, not their own. (NC-42 for $99) I'm not impressed, but I'm only looking at Yaesu stuff right now, so other brands may be better served. Their max batteries for the FT-530 are 7.2v 1400mah and 12v 800mah, each listed at $65.

W&W has a promising gizmo they call the Mastercharger I, which is some kind of smart ("Phillips Microprocessor") high-speed Delta-V charger good for any Ni-Cad from 6 to 13.2 volts. It takes adapter "cups" to charge most types of HT batteries, but extras cost $16 each. I intend to make my own (unusual) wiring adapters since it looks like the charger output plug is pretty standard. The charger with one cup is $85. Cigarette-lighter power cord is $10. (I don't know if it does more than just pass 12v power, since the charger can do 13.2v batteries.)

They had 12v 800mah and 7.2v 1500mah oversized batteries for my FT-530, each $49, which seems to be an excellent price.

I haven't received anything yet, so I can't comment on how well they meet their advertised spec, or how nice the charger is.

Here's info:

Periphex W&W Associates
115-1B Hurley Rd. 800 South Broadway
Oxford, CT 06478 Hicksville (really!), NY 11801-5017

2303. DCD mod from TAPR

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-18 05:10:05 UTC
From: jchandle@netcom.com
Message-ID: <jchandleCrKuCu.B2D@netcom.com>
Source record: 226228
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I just finished installing the TAPR DCD mod in my 1270B. I wish that I would have gotten it long ago, it's GREAT. It allows you to run your TNC radio unsquelched so the DCD circuit is only active on a valid packet signal. I highly recommend it.

2304. Need Mitrek UHF and Micor VHF manuals.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-18 05:14:03 UTC
From: jchandle@netcom.com
Message-ID: <jchandleCrKuJG.BLB@netcom.com>

I need the following manuals:

UHF Mitrek
VHF Micor (high band)
VHF Micor (low band)

If you have any extra copies that you have laying around that you wish to sell, donate, etc., then please let me know and I will gladly take them off your hands. I am also looking for the portable test set for the Micor radios. Thanks and 73.

>> What does the term "intrinsically safe" refer to? Electrical safety?
>> Spark ignition safety? Security capabilities?
>>
>> We are reviewing several VHF portables, some of which claim to be
>> "intrinsically safe" in the context of MIL-STD 810C/D and with
>> reference to DTMF encoders.

These words have a specific meaning, as defined by the National
Fire Protection Assn. Certain areas and usages require equipment
that conforms to this defined rating.

My recollection is that this refers to the safety and suitability
for use of a unit within a flammable atmosphere. This is generally
a requiment for use around flammable or explosive fumes, gasses,
and certain types of medical enviroment. An example might be an oil
refinery or where oxygen is in use.

There is a specific U.L. listing for this. Items tested and listed
by U.L. are so marked, with a U.L. logo and listing number. The
words "Intrinsically safe" usually appear next to the logo and listing
number.

U.L. publishes a list of accepted equipment. They also will sell you
a copy of the standard and testing procedure at modest cost.

>They can still be found from time to time at hamfests. Yaesu still makes
>battery portables for 2 meters and 70 cm.

Keep an eye out for the IC-290H, often found on packet forsale lists, etc.
It's a good radio, and is the size of a typical mobile. Handles SSB/CW/FM.
The IC-275H is the same size as an IC-735, and the 735 is considered
mobile capable by many.

If any of the radio manufacturers could come out with a decent SSB/FM rig
at a decent price, they'd sell a lot. The same for 6 meters!

Oh, one other rig to look at: The Yaesu FT-290 Mk II is an unusual rig that
can either be a QRP or a 20 watt mobile, and is as small as a mobile...

I have an IC-260. It is definately all-mode and useful for mobile (10W),
however it has very brain-dead memory features (no useful memories), so
it should be considered a VFO-only radio. As for the click-stop, I dis-
like this "feature" also, so I went inside and removed the ball bearing
out of which they make the click noise (look inside- it's obvious, and
no other damage need be done when the ball is removed - and it is re-
installable with needle-noise pliers). After doing this, the radio has
the same basic feel as an IC-211 - you can zip right around the band in
a hurry. I suspect you could run the radio mobile with the ball removed and
as long as you are careful not to touch the freq. dial while in motion,
there should be no problem (many HF mobile rigs behave this way).

I have two Motorola HT-50's handhelds for sale. They transmit in the 460 Mhz range on hi and lo power. They have two channels and a plug on top for a speaker mike (~$80 from Motorola). Also included are two standard desk chargers. One radio has a new battery on it that has rarely been used. I'm trying to pay bills so get a good deal and respond NOW!

Thanks,

Dave

CAN SOMEONE TELL ME THE MODS FOR THE EXTENDED RECEIVE FOR THE ICOM
W2A?

2311. Kenwood TM-733A opinions?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-19 05:30:38 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Jun18223038@calvin.vigra.com>
Source record: 226113

I'm shopping for a 2m/440 mobil rig, and right now the Kenwood TM-733A seems to fit my needs well. I'm looking for folks who have one and can tell what they like/dislike about it. Would you recommend this radio?

The best price I found so far was from Austin for $599 (no tax or S/H charges). AES wants $619+S/H. HRO gets $629. Anyone know of a better deal? I haven't gleaned any info from the local HRO on this item, so I don't feel bad getting it mail-order.

The salesman at the local HRO didn't seem to care for the radio much. He claims that it suffers from intollerable intermod problems, and that a good many of the 733A's he sold have been returned for this reason. Can anyone comment on how bad intermod is on this unit, compared to others like it? I live in San Diego, where intermod is supposedly an issue, but I haven't had any problems with my FT-530 yet, so I'm inclined to think I'd be OK with any decent mobile as well.

The big feature that makes this radio look attractive is the extra-small detachable face. I don't have any dash space for the whole radio in my Saturn, but the little faceplate will fit nicely next to the cigarette lighter. The Kenwood glossy says that the face is detachable for security, but mentions nothing about remote-mounting it. Do they sell a bracket/wire to remote mount the face? Is it still just as detachable from the remote mount as from the radio?

Are there any glaring problems or overlooked features on this radio? I called the Kenwood service BBS (at (310) 761-8284) and didn't find any service bulletins for this model, and I haven't heard any gripes on the net so far.

If you have a different radio with similar features as the TM-733A, and you like it better for some reason, I'd like to hear about it. I'm not stuck on the Kenwood, but it does seem to be the best rig so far.

Post here or send e-mail, and I'll post a summary in a week or so. Any info, or just a short note saying you have & like it would be appreciated.

Thanks very much!

-Steve

2313. Scanner docs needed

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-19 15:06:00 UTC
From: hirschj@vax2.concordia.ca
Message-ID: <19JUN199410060641@vax2.concordia.ca>
Source record: 226237

I recently picked up an old crystal controoled 10-channel
Regency scanner at a ham fest. The only other identification
markings are stamped into the cabinet (#204-c26951). Does
anyone out there know of this unit and/or have docs for it.
8 of the channels have crystals, 2 don't. Each crystal socket
has three pin entries and it does not seem to make a difference
whether I insert the crystal into pin entries 1 and 2 or 2 and 3.
Also there are 3 antenna inputs: 2 appear to be car antenna
type plugs while the third is a twin-lead type set of screw
terminals. Again, it doesn't seen to matter which antenna
input I use, the results are the same. The top pf the case has
openings for look like 2 little antennae, 0ne about 1/4 inch in
diameter while the other about half that. The unit works so I
would like to play with it (the price was right so I couldn't
resist -$4). Any help you can offer will be most appreciated.
Please e-mail at HIRSCHJ@vax2.concordia.ca.
Thanks,
Jack

This is a key board mod. It will completely erase all memorys and
reset the HT:
With radio turned off; hold down the [#]+[8]+[B] keys while turning
the radio on.
Use the ^/Scan keys and the tuning knob to get to the PL mode and set
it to the value 100. Turn radio off and then back on. Re-enter all
your memory frequencies.
Bingo.... it's done.

>CAN SOMEONE TELL ME THE MODS FOR THE EXTENDED RECEIVE FOR THE ICOM
>W2A?

Power down the unit. Then hold down AT THE SAME TIME the "3", the "B",
the "#" and the Function keys while powering up the unit. When the unit
powers up, all the segments of the display will darken. Then release all
keys and the display reverts to normal mode. In the Set mode, there is a
new parameter called "PL" which determines how many digits can be entered
from the keypad when a frequency is entered in this fashion. For example,
the default mode is "1" which allows the setting of the ones megahertz digit
and below. This can be set for 1, 10 ,and 100 and is independent for each
side of the unit.
I have noticed a frequency range for the VHF side from 118MHz to 174MHz
and on the UHF side from approx 400MHz to approx 900MHz.

I called them on this myself. Once you OWN the radio, they can not modify it.
That is, they will repair it, but will not delete the cellular bands. The
law applies only to newly purchased radios and importing of same.

2322. Wanted info on Icom IC-D1A

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-19 22:14:04 UTC
From: png@netcom.com
Message-ID: <pngCro0FG.D5I@netcom.com>
Source record: 226245

I'm thinking about getting the relatively new Icom IC-D1A tri-band handheld transciever.

I'd like to get any general reviews of this radio from anyone who's used one. I'm also specifically interested in knowing if the D1A supports a broadband continuous-coverage scanner mode like some of their previous radios did. If it does I'll probably get one. If not, I'm not sure if it's worth the rather high price to add 1.2GHz coverage.

Thanks for any info you can provide.

>My experience makes me wonder about the relative run times for >alkalines, recharable alkalines and NiCads? Doas anyone have any data
>on this?

I have no hard data, but after trying Renewal rechargable alkalines, I have switched all my nicad applications to Renewals (mostly AAs; one gizmo uses AAAs). I seem to get full alkaline life out of a set after each charging. Moreover, there are no problems about battery charge memory: if I'm unsure a set will last the day in whatever gadget I'm taking, I just pop in a charged set, and put the other ones in the charger, no matter how high or low they may be. Also, like regular alkalines, Renewals don't seem to lose noticeable charge on the shelf--something nicads can't claim at all.

In the long run, Renewals may be more expensive than nicads, since you have to replace them sooner than nicads, but I prefer not having to worry about conditioning sets of batteries for my portable gear (2m HT, Yupi scanner, CD player, and PDA).

2324. Help requested on handheld purchase

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-19 23:07:26 UTC
From: mud@leland.Stanford.EDU
Message-ID: <2u2j3e$23d@nntp2.Stanford.EDU>
Source record: 226097
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.equipment

Hi. I have been considering buying a scanner recently. In the (near?)
future I will also probably see about becoming amateur licensed...
As such, I was hoping to solicit opinions on a couple of
scanner(/transceiver) handheld units that seem to offer the features
I want:

- ICOM 2SRA (2M transceiver, 50-900Mhz receiver)
Sounds like a great combination for my needs, but the local
(note that I live in Vancouver, British Columbia) radio
outlets say that at best it is mediocre as a transceiver and
as a scanner...

- Yaesu FT-530 (2M transceiver & 440Mhz transceiver)
Reccomended to me by a local radio outlet as being a good
transceiver, and it can be modified to receive 108-180Mhz,
300-500Mhz, and 800-9??Mhz.
I'd really like to hear from anyone who owns this unit
about how useful it is as a scanner after being modified.

- Uniden Bearcat 2500XLT (wide coverage receiver)
Sounds like the best wide coverage scanner available for the
price. Local radio outfits reccomend it, but sell it for too
much. The file in the hamradio archive that describes how to
restore cellular reception for this unit warns that there may
be model(s) that are different from the one described by that
modification file. Has anyone actually seen one that cannot be
modified to restore cellular reception?

I'm told that the AOR scanners have too many intermod problems to be
useable in my local area. The Yupiteru MVT7100 sounds nice, but is too
expensive for me for just a scanner. The "Trident"(/Camnis) models that
Ace advertises sound nice featurewise, but I'm concerned that I would
not be able to restore cellular reception on any of them (again, though
this is posted from Stanford, I live in British Columbia).

Currently I'm leaning towards the Yaesu FT-530, as long as I can be
reassured that it will make a fairly decent scanner in it's extended
receive frequency ranges.

Thanks in advance for any help in making my decision!

Why is 10-year-old battery technology still being used in state-of-the
art HTs? NiMH (nickle-metal-hydride) batteries have been around for
a couple of years now (used in some camcorders, in Apple Powerbooks,
and possibly in other laptop computers by now). Further, Sony uses
lithium-ion batteries (rechargeable) in some of their camcorders for
superior performance to even NiMH batteries. Why doesn't anyone use
either of these battery types in HT battery packs?

I've been using AA NiMH batteries in the AA-battery pack for my HT
for a while now, and have experienced superior performance to regular
nickel cadmium batteries without the worry of memory-effect. Now if
only I didn't have to take the thing apart every time I want to charge
them. I found these at a local battery-specialty store in case anyone's
interested.

>Thanks for the help 73 George

Sounds like you're talking about the "VIP synthesizer", a channel switch
with many more than 22 channel positions, which indicates the channel
frequency rather than a channel number, and which replaces the original
22-position switch and diode-programming scheme. I've never seen the vendor
data on it, but I understand it was made by a company called VIP. There are
lots of IC-22S's with this mod installed.

Call Icom-USA for a mod sheet to get you down below 146 MHz. It assumes that
you still have the diode matrix board to program those channels though, so I
doubt you can do it easily (your VIP switch doesn't provide for for the lower
frequencies). The Technologic Concepts mod will allow you to replace the VIP
switch with thumbwheels, and get most of today's useable channels. This mod
involves addressing a pair of EPROMS with all the possible channels -- in 5
kHz steps, no less! Even it, though, won't quite make the rig synthesize the
transmit frequencies for the lowest few repeater pairs. The synthesizer still
has a lower limit around 144.6 or so.

Congratulations on finding a working IC-22S. I have three of them in various
states of repair -- not one is completely OK. Anybody have one to give up
for parts?

Can anyone tell me where I can obtain a Microsoft Windows 5Mhz Oscilloscope program that will run on my PC's sound board which supports stereo right/left channel input to display a lissajous pattern?

The reason I'm looking for this type of program, so I can attach my sound board's input, to my PK232 TNC's mark/space output, for tuning digital signals on the HF bands. Updates need to occur at a minimum of 2 seconds to make tuning functional, and the oscilloscope display Windows needs to be scaleable in size.

I bought an FT-101E for the same price ($300) at the Charlotte Hamfest this spring and have REALLY enjoyed it. Mine was also in like-new condition and had recently been lined up. It's a solid rig that will perform well for you. You might find a cheaper one, but it won't be in as good condition. Good luck and let me know what you decide.

I have a Kenwood MC50 mike, but do not have the cable that would connect it to a rig. My rig it a Kenwod TS-140S. Can anyone help me figure out:

Does Kenwood make a pre-made cable for this?

if not...

What the pin-out for the 5 pin connector on the MC-50 are and where I can get that odd 5 pin connector?

It's cheap! Ni-Cds can be bought in quantity for 50 cents per cell.
Can't come close to that with anything else. Ni-Cds have
been around for 100 years.

>NiMH (nickle-metal-hydride) batteries have been around for
>a couple of years now (used in some camcorders, in Apple Powerbooks,

>either of these battery types in HT battery packs?

NiMH cells are expensive, and they are harder to quick charge. They
also have a horrible shelf charge retention, which makes them tricker
to use on an occasional basis -- a definite advantage of Renewals.
Also, the newer NiCds are catching up -- 950 mAH is on its way, which
is only 25% less than NiMH, for less than 1/2 the cost.

Lithium ion is even harder to charge -- you need a temperature compensated
constant voltage charge accurate to within 0.5% to maximize cell life.
Also, I don't know how the high current discharge characteristics of those
cells rate. Remember, HT use is very demanding requiring over 1A discharges
if you're on high power -- a weak point of Renewals.

It would be interesting to see when the HT manufactuers offer a NiMH
pack, and how much they would charge for it.

>I've been using AA NiMH batteries in the AA-battery pack for my HT

>

I'm glad it's working for you. I have tried some 1200 mAh
NiMH cells and they do have the extra capacity, and I use them when
that is the overriding criteria. But I usually stick with el cheapo
NiCds since they cost almost nothing to replace when they finally poop
out. I charge them while in the pack. Used two paper clips and some
copper foil plus solder and made a jig so that I can place the

pack on the clips and make contact. Add a delta V charger ckt and
you're home free.

From: jmaynard@nyx10.cs.du.edu
Message-ID: <2u5g39$aug@nyx10.cs.du.edu>
Source record: 226115

I finally got around to building up Daniel, VS9VG (at least I think Singaproe's VS9) 's serial interface for the FRG-9600 assault V/UHF receiver, so I could use his FRGSC program. It looks like a problem I'd noted when I first got the radio is reaching up to bite me. Basically, the S meter is extremely insensitive, requiring a LOT of signal to register any indication at all. This behavior is mirrored in the AGC output on the CAT connector; since Daniel's interface depends on that to detect the presence of a signal, I'm screwed as far as scanning with the setup goes.

I think the AGC circuit is misadjusted. Is this a common problem? Is there someone out there with an FRG-9600 service manual who can get me through setting that up? For that matter, anyoen have a service manual they'd like to unload?

It's not only cheap, but they are fairly rugged--elecronically. Every
fool and their friend and whip up a NiCd charger out of a pair of transistors
and a few resistors which will safely charge NiCd's.

I can't agree more. Early generation NiMH batteries have horrid shelf
properties. Admittedly, most ham's using NiCd's are already used to
plugging in the radio at night anyway. I picked up some 850mA/h NiCd's
at a ham fest for $2.00(US)/each and I didn't look too hard. 600mA/h
cells could be had for half that.

Exaclty, discharge characteristics are very important to HT users. The
problem is, it is hard to make a blanket decision as performance depends
heavily on usage characteristics. If you have a scanner or a nontransmitting
HT drawing in the 100mA to 20mA range (typical), alkaline (including Renewal)
will perform better than NiCd by a factor of 2x to 3x. If you transmit
on that same HT, you will quickly change this ballance in favor of NiCds.

For example, an E91 (energizer AA) vs a (forgot the exact part) 500 mA/h NiCd,
the tradeoff is at around 150 mA of constant drain. The curve is in favor
of the E91 by a factor of 2x to 3x on the low current side and in favor of
the NiCd by 3x to 5x in the 1A to 1.5A range. (email me for references if
you would like to see them) Keep in mind that this is for a .5A/h NiCd.

>It would be interesting to see when the HT manufactuers offer a NiMH
>pack, and how much they would charge for it.

(sarcasticaly) Considering the price they charge for NiCd's, I don't want to know...

>>I've been using AA NiMH batteries in the AA-battery pack for my HT
>>for a while now, and have experienced superior performance to regular
>>nickel cadmium batteries without the worry of memory-effect. Now if
>>only I didn't have to take the thing apart every time I want to charge
>>them. I found these at a local battery-specialty store in case anyone's
>>interested.

>I'm glad it's working for you. I have tried some 1200 mAh
>NiMH cells and they do have the extra capacity, and I use them when
>that is the overriding criteria. But I usually stick with el cheapo
>NiCds since they cost almost nothing to replace when they finally poop
>out. I charge them while in the pack. Used two paper clips and some
>copper foil plus solder and made a jig so that I can place the
>pack on the clips and make contact. Add a delta V charger ckt and
>you're home free.

For a charge-every-night HT user, NiMH will win out if that much capacity is necessary vs the price differential. Keep in mind that charging circuitry will be more expensive/complex for the NiMH calls.

Since I seem to be the self appointed advocate of 1.5V AA Lithiums, here's my two cents WRT them:

These cells combine the best of both worlds. (alkaline and Ni-whatever) They have a low internal resistance like NiCds. They have high capaciy like alkalines. They have the discharge characteristics of NiCds. Best of all, they have great low and high temperature performance--better than both alkaline and Ni-whatever. Finally, they're really light.

Cons: they cost about $6.00(US) for two! (they did just go into volume production and have, as yet, to catch on) They are primary cells--i.e. they can't be recharged.

Just thought I'd mention them as they are bound to decrease in price in the coming years--especialy if hams grow an affinity for them. (hint hint)

Cheers,
David

2343. Where to buy equipment in Far East ??

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-21 11:43:18 UTC
From: tomrune@mac_inge.itek.norut.no
Message-ID: <tomrune-210694133816@193.156.105.53>
Source record: 226119

Hi!
Thanks for reading this message.
I am going to the Far East in my summer holiday, and I want some info
about buying equipment such as HF tranceivers, Dual Banders, e.g.

I think I am going to Hong Kong or Singapore, so if you have any addresses,
or perhaps any prices, it would be very nice.

By the way....how is it to get a radio amateur licence in Hong Kong ??

M> - Yaesu FT-530 (2M transceiver & 440Mhz transceiver)
M> Reccomended to me by a local radio outlet as being a good
M> transceiver, and it can be modified to receive 108-180Mhz,
M> 300-500Mhz, and 800-9??Mhz.
M> I'd really like to hear from anyone who owns this unit
M> about how useful it is as a scanner after being modified.

Well, here's the deal...there IS a mod for the FT-530 (I own one).
As far as I know, it covers 110-180MHz and 300-500Mhz, but NOT
800-9??MHz. In reality, though, this doesn't matter because if you want
a scanner, BUY A SCANNER! The scan rates on most transceivers aren't
even nearly fast enough to make them truly useful. One thing I want to
say, though...the FT-530 has got to be one of the best dual-band HT's
out there. If you're looking for a dual-band HT, it's definitely the
way to go.

2345. Re: "Intrinsically safe"?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-21 12:47:45 UTC
From: healy@seviche.med.yale.edu
Message-ID: <healy-210694084309@wardibm1.med.yale.edu>
Source record: 226121

My memory as to details is rather poor, since it's been over
10 years since I designed motor control systems, but the key
idea of "intrinsically-safe" is that the circuit involved is
an inherently-low-energy circuit, such that sparks are physically
impossible.

If the circuit _could_ spark, then one must use either extremely
reliable electrical protection, or an explosion-proof enclosure,
in order to use it near explosive gases.

An explosion-proof enclosure need not be hermetically-sealed, and
need not protect the equipment inside from damage. What it _must_
do is confine any explosion inside. The basic principle is that
of the old coal miner's safety lamp--there was a flame inside, but
it was surrounded by a fine screen that would block any explosion
from propagating outside.

2346. Mobile Antenna Help!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-21 13:34:10 UTC
From: jlw3@cec3.wustl.edu
Message-ID: <2u6q8i$qoc@bigfoot.wustl.edu>
Source record: 226269
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

In the continuing quest to be somewhat equipped when my license finally comes and to continue my interest in ham radio before it wanes (I took the test 6 mos ago, and I'm still waiting--yes there is a reason for the delay--yes, I've upgraded to general and my code is nearly ready for the advanced/extra upgrade, and I've not even gotten my first tech-plus license), I'm trying to decide on a mobile antenna.

I'm not willing to punch a hole in the car. In fact, I'm still a college student and the title is in my *parents'* name, not mine.

1) What kind of mount should I use? Mag mount? will that damage the paint if I take it off (I will probably keep the antenna in the trunk when not at use--I don't want it stolen or damaged) and put it on repeatedly? Trunk mount? Mirror mount is out of the question--nothing to clamp it to. I have a Toyota Camry. For the mag/trunk mount, how does the cable feed in? It seems that if it goes through a door or trunk joint, the cable will be pinched, at least a little, and after a while, quite a bit.

2) What kind of connector is better? NMO or UHF? What is the difference (In performance, or strength, etc)?

3) What does spring/coil loading do in relation to performance? Broader bandwidth? Is there lowered performance vs. a whip b/c of inductive losses or anything like that?

4) Is there any experience with ANLI Antenna Corp? They have have Model AT-2B Antenna "200W 1'10" Spring loaded 3/5.5 dBd. NMO (140-155/390-490 MHz)" that is relatively (to comet, diamond, etc) low price--$40, no mount. No gain reference was stated.

5) What is the opinion on Diamond's and Comet's and Larson's dualband antennas (I have an Icom W21AT 440/2m ht)? What is the difference b/w Comet's FL/SB/B series antennas? Between Diamond's SG/NR antennas? (I don't know too much about Larson) Are the performance gains for the "higher-end" antennas of a company worth the price difference for those more "economical"--especially when they are rated in similar power ratings and gain.

6) Recommendations? I am currently thinking to get the ANLI AT-2B + magmount for indoor use on a filing cabinet/cookie sheet because of it's short height --and I'd also use it as a scanner antenna when doing long (12 hour) drives. I'd also get a "higher performance" Diamond or Comet antenna exclusively for use on the car, as they are generally >3 feet long, plus mount. This would have to be easily removable, as drunk college kids may want such a cute antenna as a new addition to dorm decor! Or even sober ones. . .

Thanks in advance for any help you can give--oh yeah, is Diamond's mounts worth the premium you pay for them?

Thanks again!

I would like to know if any of you "Packet Hackers" have any info. on
a Contronics C200 Micro Earth Station.
It was manufactured by Contronics. The division that made it is no
longer in operation. It was bought out by GTE Spacenet. They will
not give me any info on it. Depending on who you talk to you will
get conflicting stories. Some say the info is proprietary some say
it is not. The only info they have sent me is for a 40 foot earth
listing station. The one I have is a scaled down model. ie:2.5
meter.
I hope to use this for packet radio someday. I am in the process
of acquiring my "Ham" license now. Can anyone tell me how to use
this "dish" and controller for listening purposes.
The "dish" came from a Farmers insurance agent that went out of
business. I acquired it at an auction.
I can be reached at colink@kira.csos.orst.edu Thanks...Colin.

2349. Re: (Rechargable) Alkalines vs NiCads?

Date: 1994-06-21 17:59:18 UTC
From: jerry@hnrc.tufts.edu
Message-ID: <1994Jun21.125918.2510@hnrc.tufts.edu>
Source record: 226122

Two questions:

(1)
Many HT's (all?) recommend against using rechargeables in the alkaline battery packs. The reason, I'm told, is that should the NiCads be shorted out, the worst case scenario includes an explosion. The alkalines, the story continues, wouldn't dissipate their charge as quickly and are, therefore, safe.
How do the renewable alkalines fit into this picture? Are they as safe to use in HT's as ordinary alkalines?

(2)
I haven't read or heard anything bad about renewable alkalines. But the only one's I've seen are made by Ray-O-Vac. It's been my experience that Ray-O-Vac products are uniformly inferior to any other brand name. Once or twice, I have amused myself by trying to come up with reasons why they've been able to continue in business. Can it really be that this time they've done something right? (It's kind of like coming to the realization that Radio Shack sells some products that are truly of value.)

Thanks.

2350. MICOR Channel Elements & Crystals for them

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-21 18:58:32 UTC
From: harris.pander01@ic1d.harris.com
Message-ID: <harris.pander01.3.2E073852@ic1d.harris.com>
Source record: 226123

I'm trying to move a Motorola MICOR high-band VHF repeater to the 2-meter ham band. It has a KXN1019B transmit channel element, which I would like to re-crystal for my repeater frequency.

My crystal vendor has some specs for this unit, but when I got the new crystal in-hand, the transmitter frequency is more than 7 kHz too high. Returning the crystal to the vendor did no good -- they say it checks out OK (to their specs on the Motorola part). If the crystal is good, then I suppose that either the channel element is bad or their specs for it are bad. Calls to Motorola were similarly futile -- they want big bucks to either research this or sell me a whole new element. (This is a no-budget ham project, and I don't like buying useless crystals for it).

I am hoping that somebody out there has some good specs for the crystal capacitive load in that channel element. If not, I suppose I can find the actual center freq of the crystal I have, then specify another crystal, taking into account the difference between actual and desired freqs of the one I already paid for.

Also, is there something in the channel element that might have failed? I have only one of them, and no schematics.

Any help will be appreciated.

I've seen them. These are the Lithium - Iron Disulfide 1.5V cells,
right? With the red packaging? Street price here is $4.00 per
2 pack, so they are getting cheaper. I do have one question about
those cells, and that is their standby OCV. The chemistry of these
cells is quite finicky, and the OCV can be as high as 3.2V. Of course,
under any reasonable load, it drops to 1.5V. Have you measured the OCV?
I'm just worried that 6x3.2V = 19.2V = poof to the clock circuit on
my HT, since the load there is microamps. I know that Cincinnati Microwave
specifically warned against using lithium 9V cells in their battery
radar detector for that reason.

I have a set of these cells for emergency backup, but haven't tried
them yet. Maybe I should.

Renewals are "safe" in this respect as they are alkalines and have the
same "high" internal resistance as regular alkalines. However, I would
be careful that the jacket of the cells do not wear down, as they may
provide the needed insulation to prevent a short in the pack. This is
true with most NiCds.

Rechargeable alkalines are not a new concept. The circuitry to do the
charging properly and CHEAPLY has just become available. The hack to
the cell is changing the cell electrochemical balance such that evolution
of hydrogen gas is minimized on recharge. This combined with the
regulated charge and hacking on the MnO2 electrode makes recharging
possible. For certain applications, renewals make sense -- I don't
know how well they are selling. I'm a believer of NiCds myself, but
that's because I can tolerate and work around their shortcomings.
Renewals are probably more "droid consumer flashing 12:00 vcr type" friendly.

Renewals ARE alkaline Mn cells for the most part, and will behave as so
in your HT. They have the same high internal impedance problem --
possibly worse than regular alkalines. Try a set of alkalines and
see how the HT performs, especially on high power, if that is your
primary mode of operation. The performance you
get will be similar to that of Renewals, except that the Renewals will

have slightly less capacity, and the capacity goes down with number of charge cycles. They do have good standby shelf life though.

Can anyone tell me where I might find (purchase cheaply) some 12-24 VDC
relays that I can use to switch in/out my 2m and 70cm antenna preamps?
I need to take the premaps out-of-line before transmitting. They need to
operate at 145 and 443 MHz with minimum signal lost and capable of handling
150 watts of RF output power. I perfer PC mount type so I can mount them inside
the preamp bud box. Coaxial relays (Dowell or TohTus) are big and require coax
connectors.

Thanks, Tom WB7ASR...

Since you already have an Alinco, you should look at the Alinco dual band mobile rigs. I have a 570 and a 590, and both have been flawless performers. The 570 has a great big hulking heatsink and an internal duplexer. The 590 has a dinky thermostatically controlled fan and individual band outputs. I actually like the 570 better, but both have their good points. The newer 599 and 600 are also supposed to be good.

Intrinsically safe does not only apply to circuits, but even the simple hand tools you use. If you drop these, there must be no chance of them causing a spark when they land on anything. This calls for special materials in many cases.

As for electrical equipment, another way of keeping equipment safe is to pressurise the enclosure with 'clean' air, so explosive gasses do not get inside in the first place...

What?! I haven't heard of anything like this. I have a BP-90 AA battery pack
for my Icom W2A with NiCads in it. The manual expressly allows this. Perhaps
you are thinking of the warning about using an external power supply with
the HT while the battery pack has _alkaline_ batteries in it. This can lead
to heating, leaking, or even a battery explosion. Never use the external
power while your HT has any kind of non rechargeable batteries in it.

>I haven't read or heard anything bad about renewable alkalines. But the only
>one's I've seen are made by Ray-O-Vac. It's been my experience that Ray-O-Vac

Well, the bad things I've heard about 'em are that they can't be fast-charged
and that their high internal resistance (like all alkalines) makes them
unable to supply the the high currents (~1A) that HTs can draw. And of course
they can only be recharged 25 times with noticeable degradation after 5
charges. Renewals, therefore are generally unsuited to HT use. Carry a set
of real alkalines for emergencies. As far as regular use goes, NiCads are
still the best price/performance battery for now.

As for Ray-O-Vac, maybe they supply batteries to the military to stay in
business. In my experience, Ray-O-Vac betteries have been the worst. I'll
only buy 'em if there's no other choice. Duracells and Energizers, perform
well, but are expensive. For myself, I prefer the Radio Shack (!) 'green'
batteries myself. They have an excellent shelf like, and I've _never_ seen
one leak. Best of all they're cheap. $0.39 for an AA. Can't beat that for
non-rechargeables.

>Thanks.

No problem.

I don't make this stuff up. It only reads like I do!
It must vary from manufacturer to manufacturer. When I was in the market for an HT and had narrowed down my choice to the Yaesu FT-530 and the Standard C558A, I spent an hour at HRO reading both manuals cover to cover. Both had prohibitions against the use of rechargeables. The C558A manual (page 6), under Suitable Batteries, says:
Size AA magnesium batteries
Alkaline batteries
Do not use size AA nickel-cadmium batteries

The business about the alkalines being slower to dissapate their charge in the case of a short was the (possibly garbled in the retelling) explanation given by one of the people at HRO.

Does the 570 have a removable faceplate? I'm looking for an economical
dual-bander for motorcycle use and would require this feature. Unfortunately
all of the nice new models cost more than I want to pay right now for this
use.

Any other suggestions on older models (read less expensive :) that might
meet this criteria? I'm not looking for bells and whistles, just a reliable
dual-bander with a removable face plate.

Thanks,

Steve

> use in HT's as ordinary alkalines?

Renewals have a fairly high internal resistance compared to nicads,
so they will behave much like regular alkalines in this respect. Of
course, the flip side is that they won't easily deliver gobs of amps
to drive an HT at high power :-(so use medium or low power and run
for days at a time before re-charging (I do and it works).

Possibly. I've got a set that we've used for over a year and they
still work well. Much better for occasional use than ni-cads.

I am planing to buy a dual band ht and would appreciate any info
either pro or con on the following radios.

Alinco DJ-850t
Icom IC-W21 AT
Kenwood TH-78A
Yaesu FT-530

I am considering using it with a full duplex phone patch and am also
interested in extended receive coverage.

Thanks

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

Greetings! I just aquired an MFJ-16010 (very) small antenna tuner
made by MFJ from a friend. I was told that the tuner works only with
balanced antennas (eg - gotta use a balun with a dipole, etc).
The unit comes with SO-239 connectors.
However, according to the AES catalog, this little item is supposed to
be a "random wire tuner". hmmmmmmmmm

Since I did not receive a copy of the manual, I'm wondering if some
kind soul could enlighten me on the use/operation of this little gem?
Perhaps even a copy (I'll pay of course) of the documentation - tho
that is not an immediate necessity.

I'm hoping to use this with a small QRP rig I have.

Cheers & 73 de,
Sandy WA6BXH/7J1ABV

Source record: 226145

With channel elements my experience has been it is best to send the whole thing to the manufacturers, then let them put the crystal in and 'compensate' the whole thing. They might have to change some components in the oscillator circuit to make the thing work correctly. I've done this with Jan and Crystek, and it added about ten bucks to the price + shipping. Of course this was a few years ago. I think ICM does the same thing.

Renewal Bashing (mostly accurate) deleted.

Yaesu specifically warns in BIG LETTERS that you should NOT put NiCd
batteries in alkaline AA cases (though I do it all the time.) Their
explanation is that the AA cases lack the "necessary thermal and
overcurrent protection in case of a short" and may be an explosion
or fire hazard.

OK, they are protecting their own battery pack business.

BUT, there IS some truth to this. I have a Yaesu FT-530, with
the FBA-12 AA case. Those that use this beware:

Most NiCd cells use the printed jacket as insulation. That is, the
entire can is the negative terminal, with an insulator near
the top of the battery separating the positive terminal from
the can.

The printed label on may cells (especially the cheap ones) is made
out of flimsy plastic which has an annoying tendentecy to rip, come
off, or just plain fall apart. This leaves parts of the can exposed.

The FBA-12 is a clamshell type design, where 3 cells are inserted on each
half. Now, if parts of the cans of the cells are exposed, and you
put the clamshell together, it is possible to short two cans, thus shorting
out the cells inbetween the two shorting cells.

Good NiCds can put out tremendous currents, and if left shorted, will at least destroy the cells from internally generated heat, may vent caustic solution, or explode.

My solution: Out of a thin piece of plastic (overheads work well), I cut out a square that fits snugly inbetween the two halves. The current is carried between the halves using a lip, so the sheet doesn't get in the way. This way, the two halves are isolated and the shorting problem is alleviated.

So, although the manufacturers are being paranoid (lawyer bait), there is some truth in this allegation.

I suppose that alkalines can have the same failure, but you usually end up throwing them away before the plastic wears away, and they don't have the high short circuit current problem.

-Ken

I've purchased and used packs from W&W Associates in New York on my
Yaesu FT-470 and 33R HTs. They offer packs that are a direct
replacement in both physical size and capacity (i.e. I don't have to
buy another radio case to fit a non-Yaesu battery :-). It works for
me....

2381. Rechargable Batteries

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-23 13:59:23 UTC
From: Bren.Doreck@utmb.EDU
Message-ID: <01HDVJMU852E004V8B@BEACH.UTMB.EDU>
Source record: 226255

I have been reading the Q&A about rechargable batteries in HT's, and have another question to throw into the arena. I once had a handheld CB from RS and in order to use rechargables the manual said to use 2 dummy batteries that were supplied with the radio. It used 10 akalines or 8 NiCd's + 2 dummy batteries. My question is two parts. Is this recommended because there is a higher current with the NiCd's, or am I missing something? The second part is, if dummmy batteries are a necessity, would the same hold true for HT's?

I don't see any reason that rechargeables couldn't be used in an HT. My akaline pack holds 8 batteries, and I can get a 12V recharg, same voltage and should be about the same current. Correct me if I am wrong.

2383. new HAMCOM interface with optical isolation

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-23 15:07:56 UTC
From: copeland@metronet.com
Message-ID: <CruvD8.4ur@metronet.com>
Source record: 226259

Here are two opto circuit I've been playing with for HAMCOM/JVFAX.
They virtually eliminate all computer induced rfi. I've been using
a five foot serial cable and twenty foot audio cable with this
circuit and the results are truly remarkable with JVFAX.

I've used the first circuit successfully, but recommend using the second.
The first can be built with common Radio Shack parts. The second requires
a little more uncommon LM358 and TIL181. The Radio Shack opto RECEIVER
is only rated at 20v but used at 24v and could eventually burn out.
It also may introduced problems since the +9v is not regulated and induces
error into the reference op amp output ... even though it seems to work well.

Perhaps some engineers out there may have some advice.

```
================================================================================

+9v
|-------- +9V ________ DTR
9 volt batt. --------- | 1uf | |
----- === | |
| | [ ] 1K [ ] 2.2K
|-------- | |________DSR
GND |C |
+9v ___ |/ - C
| \ / /\/ |
.1 uF |\ | ----- |\-> A
>------| |--*----------------------|- \ |A |
| |741 \______| |
| | / --------RTS
| --------|+ /
| | |/ |
[ ] 100K [ ] 100K |
| | GND
*--------------*
| |
+9V | |\ |
| -----|- \ |
| |741 \___| +4.5 REFERENCE
100K [ ] | /
|-----------|+ /
100K [ ] |/
|
|
GND

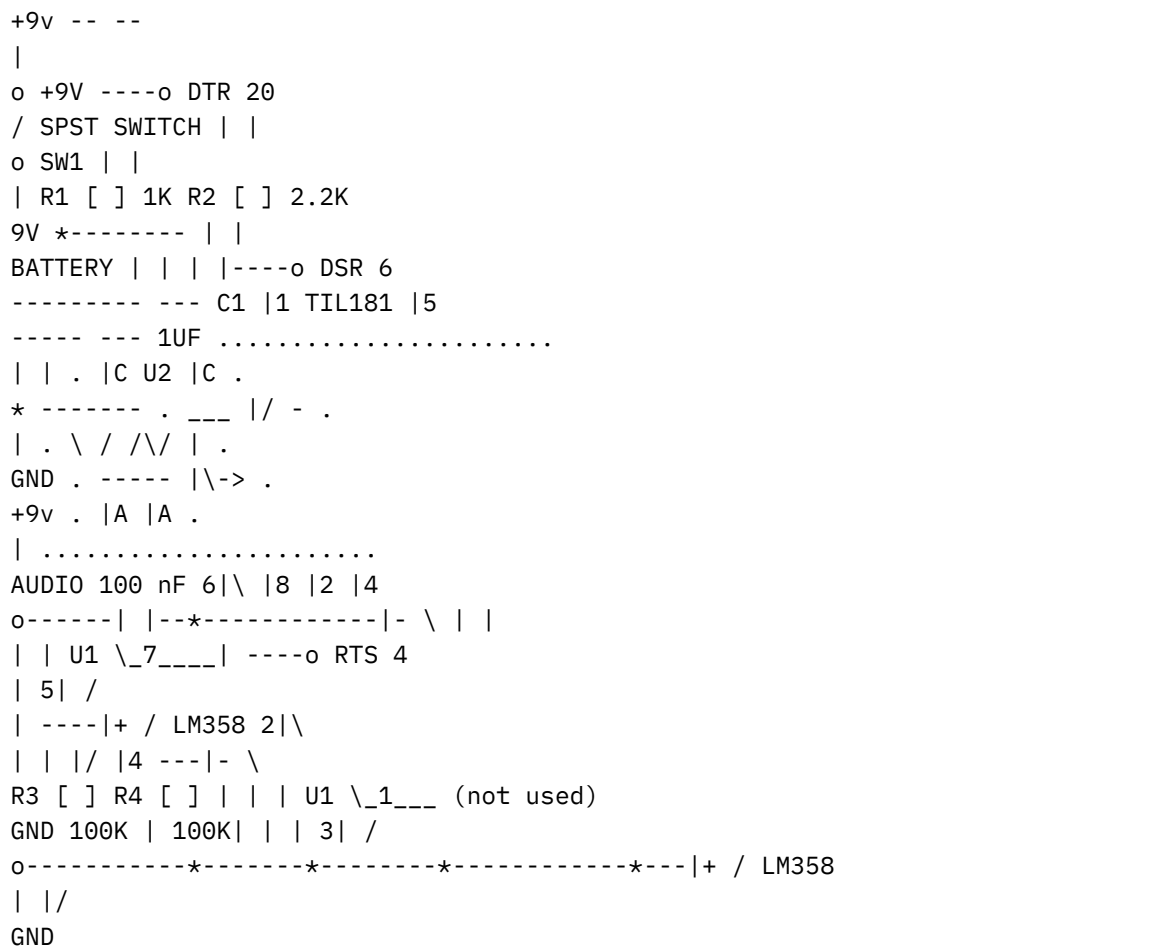
================================================================================
```

These are available at Radio Shack as a pair for $1.99 (#276-142).
This shows which is the Anode and which is the Cathode, not clear on
the package.

The LED and DETECTOR must be positioned right up against each other and
exactly aligned to get maximum light transfer. The sides with the little
lense like dots must be placed together.

==========

I'd recommend this second circuit for more stability and possibly accuracy.



```
================================================================================
| ** NOTE** |
| After constructing, measure LM358 pin 7 with no audio on the input. |
| It should be high (~8v), if it is low (~0v) it will drain the battery |
| in only 20 hours or less. |
| |
| To correct this: Disconnect R1 from +9v and reconnect to U1 pin 7. |
| Disconnect U1 pin 2 and reconnect to GND. |
| |
================================================================================
```

The LM358 is a single supply opamp and can be substituted with the LM2904, LM158, or LM258. (The dual supply 741 can not be used as a substitute.)

The opto isolator IC can be substitued for many other types. The 4N35 has been tested successfully. The discrete infared emitter/detector from Radio Shack has been tested successfully.

I tried to use a darlington opto (TIL113), but couldn't get it to work. A darlington opto circuit would only require 1.5ma average. That would make battery life about 133 hours. Maybe I'll try again later.

```
================================================================================
```

MORE NOTES:

The 9v battery could be substitued with a 9 or 12 vdc adapter. However I've found the clearest pictures occur when both the radio and HAMCOM are running off batteries ... at 6am 8).

A 9v battery should last about 50 hours while audio is present (assuming 200ma hours for a battery). If no audio is present the battery will last 400 hours.

The battery life could be a problem for people who leave HAMCOM running all night using the timed FAX option. Battery would only last a week.

If you have any advice or knowledge that could improve this, please let me know.

copeland@metronet.com

```

2384. Please help me decide -- Standard c528a or Yaesu ft-530?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-23 15:28:53 UTC
From: lhr@zurich.ai.mit.edu
Message-ID: <LHR.94Jun23152853@void.ai.mit.edu>
Source record: 226270

I'd like people's opinions on the Standard c528a and the Yaesu ft-530. I'm new to ham radio (just passed my Tech last night), and I'd like something rugged and reliable. I'd also like to know if it is possible to modify either tranceiver to receive on more than just the factory frequencies. For example, I have a file that says that by punching a few codes into the 528 keypad, it will receive a wider range of frequencies. The file is a couple of years old, but is this still the case for the newest incarnations of the 528?

Thanks in advance. If people send me personal email, I'll post a summary of the replies in about a week.

-Luis

The Alinco 570 doesn't have a removable faceplate but I'll agree with
Gary, the 570 is a solid rig. If the removable faceplate is a top
criteria, look around for the DR-599T...should be places discounting
this in favor of carrying the newer Alinco dual-band mobiles.

Could anyone recommend a current type-accepted radio that would be suitable for 9600 or possibly 19200 bps?

Should be fast tx/rx switching, wide, flat IF response, xtal control would be OK, as would be synthesized. 25 watts output or more. Preferrably UHF-HI.

tnx for any leads

My father has an FRG-9600. When he got his several years ago he also got a tiny HF converter with it. It is a small box about 2"x3"x1" that attached directly to the antenna jack on the scanner and a small DC cord connects to the acc. power jack. It just upconverts everything by 60MHz. I had a look inside once and there's not much to it so given the right info it probably would be easy to make one. FWIW.

Here is the ad I posted recently:

Hello all! I am in IMMEDIATE NEED of some Motorola
walkie-talkies. I am looking for either Motorola HT-600,
MT-1000, or Motorola Radius P200 units. They must be 5 Watt
units and have at least 6 channels and must cover the 157-174 Mhz.
range. I am also interested in accesories for these units, such as
speaker/microphones, headsets, etc. Let me know what you have.
WILL PAY CASH or can trade for hardware and/or software items
from my ads. Leave message here or give me a call.
Darryl Linkow
(818) 346-5278 9 am - 5 pm PDT
(The VERY BEST time to reach me is ANY MORNING right at 9 am PDT)

Well, a man called me from the Los Angeles area and we negotiated a
price. He offered to come over and bring an HT-600 to me. Said he
had worked at a studio and they gave him this radio. Since my
schedule varies as to when I am home, I suggested and he agreed to
send me the radio via UPS. As of today, June 24, I have not
received this radio and charger. Unfortunately, I did not get the
name and phone number of this person. If you are reading this
message and you are the man I talked to, please contact me ASAP at
the number above.
Regards,
Darryl Linkow

Bren, go dig up your manual: I have what is _probably_ the same RadShack
"handheld" CB (requires a BIG hand!). It consistently wants 12 volts:
i.e. 10 1.2 NiCads _or_ 8 1.5 alkalines (plus 2 dummy place-holders so
the 8 real batteries stay in place). Believe you had this reversed.

>My question is two parts. Is this recommended because there is a higher
>current with the NiCd's, or am I missing something?

Really think you just had the alkaline vs. nicad requirements backwards.

>The second part is, if
>dummmy batteries are a necessity, would the same hold true for HT's?

Dummy batteries would be a waste in the typical H/T for amateur use.
The supply voltage determines maximum output power. Dummys would just
take up space and not provide any more voltage _or_ current.

>I don't see any reason that rechargeables couldn't be used in an HT. My
>akaline pack holds 8 batteries, and I can get a 12V recharg, same voltage and
>should be about the same current. Correct me if I am wrong.

Rechargeable batteries are used all the time in H/Ts. The original
question revolved around safety issues and factory recommendations
concerning use of third-party NiCads in a clamshell battery pack.
Naturally, the maker would a)like you to continue to buy factory
battery packs from them and b)NOT like to be thought of as liable
if Johnny packs his clamshell with defective NiCads and has a nasty
accident (alkalines are much less likely for this to happen as they
are constucted and tested as "consumer" products).

And just for the record, and 8 pack of NiCads has neither the same
voltage nor current as an 8 pack of alkalines. The observable
difference to the H/T user is how high an output power is available,
how long that power is available, how do the performance curves differ,
how much current is available for operation, and (of course) the
question of disposal vs. recharge.

I am just into scanning/ham radio. I bought my first radio about 3 weeks
ago and it is a TH-78A. I am quite happy with it and have no complaint.
A ham equiptment shop salesman told me that the TH-78A "is the best on
the market and there is nothing come even close to it."

Well, sort of. It allowed the radio to be tuned below 60 MHz, supposedly. I did it to mine and still could not get below 60 MHz from the front panel; it will tune down there from the CAT interface, but the sensitivity *really* falls off - I have a hard time hearing the local Channel 2 TV station's audio at 59.75 MHz...

Basically, you add 3 jumpers at the top of the band unit board, near the front of the radio.

>dummmy batteries are a necessity, would the same hold true for HT's?

Oops, I think you had it backwards, or maybe RS had it backwards. You want
to use either 8 alkalines + 2 dummies OR 10 NiCds. This is because
the terminal voltage of NiCds are 1.2V while alkalines are 1.5V
(on paper). Either way, you get 12V. Of course, with NiCds, you will
get 12V for most of the discharge curve, while with alkalines, it
slowly droops down. NiCds do have higher current capability, which
is probably good in a handheld CB, since you are putting out 4 watts
carrier, PLUS modulation. (Isn't AM wonderful?)

>
>I don't see any reason that rechargeables couldn't be used in an HT. My
>akaline pack holds 8 batteries, and I can get a 12V recharg, same voltage and
>should be about the same current. Correct me if I am wrong.

No, nothing prevents you from using rechargeables in an HT. The packs
are NiCds. Read my earlier post about using NiCds in alkaline packs
though. You need to be careful not to let them short after repeated
use.

You've got that backwards. You use the "dummy batteries" with 8 alkalines
(8*1.5=12); no dummy batteries with 10 nicads (10*1.2=12).

Hi,
I have W21 and with the keypad mod I can receive 50-299.90, 300-999.90MHz.
But the sensitivity is not too good outside the ham band.
I also have TH-28A, which is the 2m version of 78. I like the alpha-
numeric channel display and the auto-repeater offset. But compare to
W21 2m and TH28, the TH28 suffer some intermod when I'm near high RF areas.
W21 does not have auto offset but the scan rate is much faster than TH-28.
Remember, I'm not comparing W21 and TH78, but TH78 should be similar to 28.

winston.

>I actually like the 570 better, but both have their good points. The newer
>599 and 600 are also supposed to be good.

A few comments regarding the DR600T, which I own...

Alinco advertises the fact that it has remote control capbility via DTMF
tones sent from another device (typically an HT). These remote control
commands are accepted (with optional "security code", really just DTMF
squelch) on either band, as it is a dual band rig.

You CANNOT specify
just ONE of the TWO bands as the "remote channel". That means, that if
a repeater on the band you are crossbanding into is passing DTMF tones
through to it's output, those tones have the "potential" to alter your
radio's configuration! This actually happened to me when our repeater
controller was temporarily passing ALL tones through. SOme jammer was
on randomly hitting his key-pad. He actually managed to hit my
3-digit DSQ sequence and then, via the next DTMF sequence, move my radio
off frequency. Probably a one in a million chance, but it DID happen.

A more serious problem, which Alinco has admitted to, also exists...

The DR600 will move the UHF side to a seemingly random frequency
while in remote control mode! This can happen while in BOTH cross-band
repeat and remote. You then lose all control. The radio then happily
crossbands any activity on the 2-meter side to whatever UHF frequency it
happened to move to! Alinco DOES claim to have a fix. All you have to do
is send in your new, fresh-out-of-the-box radio back to the factory. :-[[
NOT a happy situation.

BTW, with remote control disabled, the DR600 will crossband all day
just fine. No problems. However, if you are looking for a radio with
remote control, you may want to consider other makes.

If you do NOT need remote control, it is a pretty good performer, RF-
wise. IMO, the front panel, however, looks like it was designed by
some government committee.

>suggestions about the explorer? i probazbly will get a yaesu ft-890
>or similar rig... let me know what you have installed in your
>"yup(pie) mobile"...

I have a 94 Mazda Navajo, same truck, different nameplate (it says
"built by Ford for Mazda" on the doorpost)

There's little space for a radio in this truck! Here's what I did:

In my truck, I decided on remote operation, and put the radio
in the rear by removing the "pocket" in the rear, passenger
side (where the subwoofer speaker goes for the JBL sound system option)
I put a home made bracket in, bolted to a crossmember, and installed
a cellphone and radio. Two antenna line go up the rear post
and feed roof mount antennas.

For power, put in a pair of 8 AWG lines going straight from the battery
to the rear. I mounted the control head for the radio on the dash on
a bracket, and it partially blocks the "4x4" button and air vent.

I tried installing the remote in front of the dash console, but
I found I was keeping my eyes off the road too much. (Can you say:
Near miss head on collision?) This was a better looking location,
but outright unsafe for me. On your lager radio, it'll be tough,
even with remote control, to install everyting attractively.

My cellphone is on a custom bracket, mounted at an angle to
the right of the heater controls. This worked out well, but I'm
not sure a radio control would work there. Maybe up higher, but
still angled toward the driver would be workable.

This truck needs a bigger alternator and battery, IMHO. Maybe I'll
get around to changing these, or at least the battery, soon.

(Beware of installing anything on the drivers side near the rear wheel
well. That's where the ABS computer is, and you don't want to interfere
with its operation with RF. Keying the TX and having all four wheels
lock up would be an unpleasant experience!! If you have a premium
sound system, the amplifiers are mounted above the passenger side
rear wheel well.)

This install was a lot of work, one of the hardest mobile installs I've
ever done. The thinness of the roof surprised me. Be careful if you

are considering an antenna of any size. (Next time, I'd mount the antennas to the roof rack. I figured this out too late.)

One thing I did right: I went down the dealer and studied the body and electrical manuals before I installed anything. I then knew where and what everything was up front. Big help.

BTW, some have complained about the fuel pump causing RFI. I've had no such problems.

Regards,

Alfred Lee <alf@kaiwan.com> writes:

>A ham equiptment shop salesman told me that the TH-78A "is the best on
>the market and there is nothing come even close to it."

Well, it is a good rig, but several others do come close. The main
drawback to the th78 is the interface, kinda non-inyuitive, and it is
fairly sensitive to strong out-of-band RF.
I havre used the yaesu ft530 and it has a wierd VFO setup and
i found it hard to use in dual-in-band mode since you
can only tx 2M on one VFO. Why this is not listed among the "features
in the ads, i do not know ;-)

The Standard dualies (so many...) are great rigs, rather pricey and no
alpha-numerics. But, definitely a toss-up if bucks are not limiting
your decision. You will be using the rig ALOT, so make a good choice.

The Alinco seems to be serviceable, but so many owners bash them
in these usenet forums that something MUST be up with them. Mostly
the probs seem to be reliability and intermod rejection.

ICOM has their following, but i have not used em, so ... no comment

Good luck,

pete, n1qdq

>I'm new to ham radio (just passed my Tech last night), and I'd like
>something rugged and reliable. I'd also like to know if it is

This is not much of a choice, i feel (IMHO) that the standard is the
winner here. I like the 530 and it sounds good, and is cheaper, but
it does not handle dual-in-band well. The VFO setup is balky, and
its on-rig audio is scratchy.

If the standard is to much $$$, give the kenwood th78 a listen
and take your time, it looks like you have 10-14 weeks to make
this decision. In the mean time you can monitor 2M and 440
with a used scaner for 35-75 bucks.

congratulations,

pete, n1qdq

I have owned a 730 for many years. I have always been pleased with it. It has been in use both as a home rig and mobile. Both applications have been excellent. I quite often get good comments on the audio. Granted, it does not have many of the newer rig features, but it is a solid, easy to use rig. I bought mine new when it was a current model.

I think your memory is faulty. The dummy batteries were installed when
you used alkalines, and removed when you used NiCds. That's because the
alkalines are 1.5 volts while the NiCds are 1.2. So 8 alkalines is 12
volts, and 10 NiCds are 12 volts. The CB HT was designed to run on 12
volts.

>
>Bren
>KC5GWA

I'm pretty sure you have this backwards. I too had a RS handheld CB many
years ago (OK I confess!!) and it called for 8 alk's or 10 NiCd's.

8 * 1.5V(alk) = 12V
10 * 1.2V(NiCd) = 12V

>from a FT-1000 phone jack??)
>
>73's Robert WB5CRG

Well Robert,

I have a DSP-40. The bandpass functions in the SSB and CW modes
are very good. However, the "Noise" function does not work as
a noise filter. You will notice a difference in the "level of
the noise" simply because of the bandwidth limitations of the
filter. The ONLY difference between the SSB and Noise functions
is the bandwidth. They both will remove carriers.
It is worth the $80 for the filter.
NO! it will not work very well from the headphone jack of your
FT-1000. You must use the external speaker jack. I have
the FT-890 and it works great. You will need to purchase an
adapter to go from mono to stereo for your headphones. If the
FT-1000 is like the FT-890 it has a stereo headphone jack. The
DSP-40 does not so the audio will come out of only one side
of your stereo headphones.
There is a good article in the July QST on the DSP-40. It states
that the manufacturer is going to "reword" the specifications
for the "noise" filter.

Kevin

I will second that. I bought mine at a flea market. Nice rig
to use. Only caviat is to be careful about the SWR it runs
into. I know other owners who have had to fork out 150
bucks for driving a poor SWR. The 250 Hz CW filter, if
it is fitted is a pleasure once you get used to it. I use mine
as a base station.

JL>
JL> 1) What kind of mount should I use? Mag mount? will that damage the
JL> paint

Probably, over time. SOME (not all) mag mounts have a thin strip of rubber (polyurathane?) on the bottom. Larson has them. Don't know about other brands. Even the high quality Larson will eventually lose the rubber coating due, I suspect, to high temps and sun degradation.

JL> if I take it off (I will probably keep the antenna in the trunk when

JL> Trunk
JL> mount? Mirror mount is out of the question--nothing to clamp it to.
JL> I have
JL> a Toyota Camry. For the mag/trunk mount, how does the cable feed in?

It comes thru the crack between the body and the trunk lid (or door and body). Usually, mag mounts are used for only a short time. Rental car for example. In every case the large, soft "seal" found on any opening in the car provides a cushion and does not damage the coax. I have used the same RG-58U on three trunk lip mounts, 12 years total service.

JL> It
JL> seems that if it goes through a door or trunk joint, the cable will be
JL> pinched, at least a little, and after a while, quite a bit.

See above. How often do you open a trunk? In your case, maybe many. But not most folks. You may have an exaggerates idea of vandalism. At one time an extra antenna on a car was unusual. Not now. Look at all the cellular phones around. And all the commercial radio users.

JL>
JL> 2) What kind of connector is better? NMO or UHF? What is the
JL> difference
JL> (In performance, or strength, etc)?

NMO is a motorola type. Larson and others use them in their coils to screw onto the mount. It is the most common. Don't know what you mean by UHF.

JL>
JL> 3) What does spring/coil loading do in relation to performance?
JL> Broader
JL> bandwidth? Is there lowered performance vs. a whip b/c of inductive
JL> losses
JL> or anything like that?

Nobody uses a spring except for Diamond (I think?). And the Diamond spring type is typically used on their very long (60" plus?) dual banders. And of course on an HF antenna. You don't need one unless the antenna is LLOONNGG.

JL> 4) Is there any experience with ANLI Antenna Corp? They have have
JL> Model
JL> AT-2B Antenna "200W 1'10" Spring loaded 3/5.5 dBd. NMO
JL> (140-155/390-490 MHz)"
JL> that is relatively (to comet, diamond, etc) low price--$40, no mount.
JL> No
JL> gain reference was stated.
JL>
JL> 5) What is the opinion on Diamond's and Comet's and Larson's dualband
JL> antennas (I have an Icom W21AT 440/2m ht)? What is the difference
JL> b/w
JL> Comet's FL/SB/B series antennas? Between Diamond's SG/NR antennas?
JL> (I
JL> don't know too much about Larson) Are the performance gains for the
JL> "higher-end" antennas of a company worth the price difference for
JL> those
JL> more "economical"--especially when they are rated in similar power
JL> ratings
JL> and gain.

How much gain do you need to hit a repeater? Not much, usually. As to power, unless you are planning to do "grid work" on SSB you don't have the right kind of radio anyway. You will find that either the talkie will be adaquet or a small (25 watt) amp is plenty.

JL>
JL> 6) Recommendations? I am currently thinking to get the ANLI AT-2B +
JL> magmount
JL> for indoor use on a filing cabinet/cookie sheet because of it's short
JL> height

Make a dual band ground plane antenna out of coathanger wire. See the Handbook or an Antenna handbook. Costs nothing (except for the PL 259) and works great. Hang it from the ceiling with a piece of string and a thumb tack in the ceiling. Or a vertically polarized dipole (one band only). Scotch tape it (them) to the wall or to a closet door. You can even make a beam out of two or more and point it by swinging the door! Get a ARRL antenna handbook. Read it. Make something!

JL> --and I'd also use it as a scanner antenna when doing long (12 hour)
JL> drives.

JL> I'd also get a "higher performance" Diamond or Comet antenna
JL> exclusively for
JL> use on the car, as they are generally >3 feet long, plus mount. This
JL> would
JL> have to be easily removable, as drunk college kids may want such a
JL> cute
JL> antenna as a new addition to dorm decor! Or even sober ones. . .
JL>
JL> Thanks in advance for any help you can give--oh yeah, is Diamond's
JL> mounts
JL> worth the premium you pay for them?
JL>
JL> Thanks again!
JL>
JL> --jesse

Go buy yourself a trunk lip mount (mounts ON the trunk lip with setscrews on the bottom. No holes in the car at all. Or a L bracket mount (mounts AGAINST the side of the "well" surrounding the trunk). Or put it on the front alongside the hood. Uses two self tapping screws on the side of the well. Not visible from outside the car. The mount should have an NMO mount. Buy a dual band Larson antenna. The one about 3 feet long (2db gain on 2 meters, 4db on 440). Screw it on the mount. Run the coax thru the trunk to the passenger compartment. Route it under the carpet and the removable covers which clamp the carpet at door openings. If you simply run it under the carpet and have lots of passengers steping on the carpet (and thus the coax)....this is NOT good!

One caution using a handy talkie. The constant flexing of the antenna mount (BNC) by the coax and its end connector when you pick up the talkie will eventually cause the BNC on the talkie to loosen the solder joint (its not screwed down, except to the case) on the circuit board and cause an intermittent connection and finally failure. This is easily repaired, by disassembly of the talkie and resoldering, but why look for work? Also, the constant flexing of the coax will also cause the coax to fail. And don't load the whole thing up with a PL-259 and an adaptor. Put a genuine Amphenol silver plated BNC on the end of the coax. Yes I know they are hard to install and solder. Learn how. And forget those long antennas that you put on the talkie. For the same reason.

Instead mount the talkie some place convenient (where you can read the dial and work the controls). Velcro works nice. Get a speaker mike. If you don't like the sound, rework the speaker mike connector plug so the talkie speaker is used, or a remote speaker.

With a remote speaker you can put the talkie IN the arm rest box. You will find that you will settle down on one repeater, cause you like the

From: ray.wade@michaelr.com
Message-ID: <940626043033331@michaelr.com>
Source record: 226062

********Continued from last message*********
.....that you will settle down on one repeater because you like the folks there. So...you won't need to be able to see the dial. If you leave the talkie in the box, it will be less likely to be stolen, since it will be out of sight. You will also soon discover the it is a real pain in the butt to drag the thing in and out of the car, so you will buy a mobile rig, and leave it in the car. Buy a burglar alarm for the car.

If you really feel the antenna is in danger from theft, I have seen "fold down" mounts that would swing down into the trunk (with the trunk open) or up to use. The trunk locks it upright when you shut it. I had one of these that I think was made for CB use. You might check a CB shop, anyone else out there remember these things?

Have fun, and welcome to amateur radio.

2430. Azden 2 meter mobile tranceiver for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-25 23:32:37 UTC
From: raney@teal.csn.org
Message-ID: <Crz82E.I11@csn.org>
Source record: 226056
Cross-posted to: rec.ham-radio,rec.ham-radio.swap,rec.radio.amateur.equipment,rec.radio.swap

Azden PCS-6000H 2 meter mobile tranceiver w/antenna
- 45 watts with 10W low power setting
- 20 channel memory with scan.
- Very easy to program.
- Wide frequency coverage (receive 118-135.995 MHz AM aircraft band, 140-173 MHz FM with transmit over 140-149.995 MHz).
- Built-in tone encoder, numeric keypad on mic
- Mobile antenna. Base loaded with 5/8 wave stainless whip.

Both are about 4 years old and in perfect working condition. I sold the truck they were in and don't plan to replace it.

The comparable current model is $340 from Azden + about $50 for the antenna from a mail-order company.

Will sell both for $200, and I'll pay shipping anywhere in the U.S.

No risk purchase: charge it to your Visa, MasterCard or American Express card. If you're not satisfied, the credit card company will ensure that you get your money back.

2431. FOR SALE: NEW KENWOOD TS-850S

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-26 02:07:30 UTC
From: hadleyv@et.byu.edu
Message-ID: <2uint2$l13@bones.et.byu.edu>
Source record: 226057

A friend of mine bought a Kenwood TS-850S HF Tranciever at the end of last November (1993). He passed his Technician license last Sseptember but it was lost by the FCC so he had to retake the exam (he lost his part too) and didn't end up getting his ticket until a few weeks ago. In that period of time the rig has just sat in a locked cabinet and has only been fired up twice (for TX) besides a little listening from time to time (he let me make a both of those contacts on it so he could see things in action). He also has the PS-52 Heavy Duty matching Power Supply to go along with it and the SW-2100 2Kw SWR Power meter from Kenwood as well. All of these things were purchased brand new and includes the original packaging and manuals. They are in BRAND NEW Condition. He is selling it because his Dad (who actually purchased it in anticipation of his own license and was loaning it to his son) realized that he needs the money and will reinvest in it in a year or two. I know, I know, it would seem a little short sighted but thats his decision. This Rig is an excellent rig (I own one too!). He is asking the following:

TS-850S HF Tranciever (No Internal Antenna Tuner
but can be added easily as an option) $1250
PS-52 Heavy Duty Matching Power Supply $230
SW-2100 2Kw SWR/Power Meter (Kenwood) $120

He would Like to sell it locally (in order to avoid shipping charges) but if the buyer would pay for the frieght other arrangements could be made.

Please contact me by email if interested or by phone.

My phone number is (801) 371-2301. If not there PLEASE leave a message. Again, you can contact me by email as well.

Source record: 226060

I'm posting this request on behalf of G3ZDM (Chris Muriel in Manchester, UK)
who has Internet E-Mail but no news server at the office.

****
Subject: WANTED-ICOM IC970A 13 cms Module

Has anyone out there got a 13cms Module for the ICOM IC970A multimode
vhf/uhf base station that might be surplus to requirements?
This module,part number ICUX98,is only available to special order
in UK as 13cms is considered a specialist band.
It occurs to me that someone may well have bought one & then discovered
that they'll never use it due to low general activity on 2.3 Ghz.
There were a couple of them knocking around ICOM dealers & available
at a good price but these seem to have vanished recently!
Otherwise they're 1399 UKP in UK (no chance) & special order anyway.
They're 1399 DOLLARS in USA so if I can't locate one here it'll
be cheaper to import one from the States.
I can be reached as follows:
PHONE: 061-973-1572 (International +44 61 973 1572)
FAX: 061-905-2846 (International +44 61 905 2846)
& Internet Messages to (Chris.Muriel@analog.com)

For what it is worth, I like the Standard 558A best of any of the dual band handheld radios. It has an outstanding receiver with the capablity to receive am aircraft, marine band, and the 800MHZ band as well. It is expensive, but worth the price in my opinion.
Good luck.

I've been intrigued by the ads for the Standard C108, the super tiny HT that Standard has just introduced. Obviously it will be a limited appeal rig with its 230MW!!! transmitter. I read a review of the UHF version of this HT in a European magazine that said it was really quite a nice piece of equipment with a hot receiver, good selectivity, real AM/FM receiver, etc.
Has anyone any experience with this rig that they'd care to share?
Thanks and 73, Dave AA5NU

>alf@kaiwan.com

The 78A is a very nice radio. I purchased one myself. However the
Alinco 580 is a very capaible radio (very close in features to the
kenwood) and the Yaesu 530 has more fetures, but it costs a fair bit more.
I have been very pleased with my radio, I just wish the FCC would send me
my licence so I can acctually talk on it !

Dismondo.

I have the kenwood and all my ham friends are green with envy. However
both radios are very comperable in features: I, like your self could not
decide with to purchase. Since the two seemed to be almost the same, I
wnet by the best deal I could find and at the time the Kenwood was the
least expensive (if you call almost $400 least expensive !).
I doubt that you could go wrong with either one.

Dismondo.

>power while your HT has any kind of non rechargeable batteries in it.

My Yahoo FT470 & 411 say NO NICADS in the AA pack. My Icom 2SRA (just like your W2A) take NiCads just fine. Its probably because the charger circuitry is built into the Icom radios instead of the pack. Although there may be some danger for some radios, I think the warning is more to protect their battery pack profits than the radio.

Source record: 226075

Greetings, all.

As I have not achieved critical mass in the number of orders for the Motorola GPS engines, I am shutting down the group purchase.

I am on vacation for the next two weeks. If, upon returning, there has not been enough orders received to reach the magic 100 mark, I will be returning the checks to those who have sent them to me, and discontinuing any efforts in this area. As of now, I have orders for about 35 units. For those of you interested, that's about $13,000 sitting on my desk.

Thanks for your time, efforts and wonderful interest in this matter.

Regards,

Tom Bonomo

I've had an FT-11 for a couple of months and I'm quite pleased with it. I think of all the HTs I've owned over the years, the FT-11 is the neatest, smallest and most fun of all. And yes, it does have wide band receive and AM aircraft coverage.

The only thing I miss with this xcvr is a direct dc input jack, but the accessory mobile adapter is reasonably priced and provides dc power for 5 watt operation (you'll really need to buy the external speaker-mike in order to utilize the adapter appropriately.)

Source record: 226076

RESPONSE to Jesse Wei's questions:

1. MOUNT. Magnet mounts are fine and, when careful, don't damage paint. You might want to use a piece of waxed paper between the mount and the car body, just in case. The mag mount can easily be removed and put in the trunk.

On some magmounts, the cable used is in RG58 which is usually small enough in diameter to go through the large weather stripping of a car trunk without significant pinching. Some mag mounts use a larger RG8 or Japanese equivalent cable which may still go through the weather strip OK.

2. NMO vs. UHF. I don't have the specs but my impression is that there are marginal differences in performance on the 2M or 70 CM bands in comparing the NMO and UHF type connectors for the antenna. If you think you might use 1.2 ghz someday, you may want to consider buying a tri-band antenna with an N connector...BTW, I use NMO and N connectors on my present antennas. The NMO was chosen because that's what Ham Radio Outlet had in stock that day. I.e., I never really had to make the UHF vs. NMO decision but I remember wondering about the differences too on my first antenna buy.

Since you'll be using your HT as the mobile rig, you may want to consider putting a BNC connector on the radio end. I suspect this will increase your performance more than the difference between a UHF and an NMO.

3. SPRING/COIL. I'm not sure what you're referring to. I think what you're talking about is that some dual band antennas use coils with Allen set screws and others wind a coil right out of the antenna element, itself. I have no preference and I let the antenna manufacturer/designer decide which is best for them. From my understanding, these coils are integral part of designing a multi-element, co-linear antenna which results in more gain, not losses.

4. ANLI vs. Others. I have not owned the AT-2B model which you've mentioned. My only advice is to take a close look at the antenna's construction and compare it to a top of the line Diamond. I can tell you of my experience with a Comet B20NMO which I owned. The hinge feature was nice but this particular antenna's spring was just weak enough, or the mechanical connection was just off enough causing the antenna's hinge to pop up and lay down when driving on the freeway or going over bumps. Being a good Ham, I tried to take the antenna apart to remedy the problem but broke it and ended up throwing it away...

5. Diamond vs. Comet vs. Larson. I now own a Diamond NR770NMO and it's great and I bought it used too, saving some more money! I also own a

Larson 2M monoband which is nice and flexible. I already told you about my Comet experience...oh, and I own a Diamond NR-124 monoband for 1.2 ghz.

I think the slightly higher gain, while useful for an HT, would not be as important to me as quality construction. Using an HT, while mobile, I think the gain differences between an SG7500 and an NR770 will be insignificant to you, but do consider the length, too. The SG7900 is 62" and not usually recommended for a magmount. I think an advertised 1db difference may be noticeable but anything less is debateable.

6. LAST THOUGHTS. I trunk mount could also be used which will clamp onto the edge of your trunk. Paint should be OK as the set screws tighten from the underside of the trunk lip and the part of the mount which touches the top of the trunk's paint is also cushioned or designed to protect paint. The cable kits may use the RG58 size or, if using bigger stuff, have a short skinny piece of coax spliced in just for going through tight fitting weather stripping. When parking in questionable college areas I would recommend, simply, unscrewing the antenna from the mount and putting the antenna in the car.

Just remember, these comments are just what I would do. Whatever is done is not necessarily right or wrong, and it's all just time and money. If it doesn't work out the first time, just buy (or make) and try again. As often quoted by me, "When in doubt, by both!"

Good luck. Your ideas, so far, are sound. I guess you just need to decide on mounts now.

Hope you included a fuse or breaker at the battery. Things could
get pretty hot if those 8 AWG lines got together, or touched the
vehicle frame (for example, in an otherwise minor fender-bender).

2463. Kenwood TM742A problem

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-28 05:13:32 UTC
From: 52@suzie.tccn.com
Message-ID: <2uobhs$g14@calvin.tccn.com>
Source record: 226086

Greetings, folks...

I've owned my TM742A for about a year and a half now, and I've got a really bizarre problem I wondered if anyone might have seen before...

About a year ago, I had just finished the installation of the radio in my car, and I started programming the memories with various and sundry frequencies in the Minneapolis area. As I recall, I got into the Minneapolis Police Dept frequencies on 440 (460.100, 460.125, etc), when all of a sudden, the rig completely locked up - wouldn't accept input or anything, and about 30 seconds later, it shut itself down.

I sent the radio back to the dealer, and they performed a hardware processor reset - disconnecting the lithium battery, and reconnecting it (the darn thing is *soldered* to the board, of all things...).

At the time, I thought it was just a fluke...

Two days ago, I was programming the same frequencies into memory, and guess what - it locked *again* - exact same symptoms as before.

The processor seems to have locked in some sort of odd loop - if I hold the power button on for about 5-7 seconds, the unit will come on, but all of the display segments are lit up, and it shuts itself down again after a short period of time. It also indicates "-on-" when I turn the ignition on in the car.

I plan to give Kenwood a call tomorrow and see if they've seen this before, and if they know of a fix for this problem.

Has anyone else seen this behaviour in the 742?

Two other minor things I've noticed about the rig:

1. The clock gains about 15 minutes every 6 months or so.

2. Somehow, when I've got the DTMF remote enabled, it'll pick up random noise from somewhere and change some of the settings for the currently selected channel. I know at least one other person who experiences this as well...

Any information would be *greatly* appreciated. If anyone knows how to perform a hardware reset without desoldering the battery, I'd be in your debt...

Yes, I did just that. I got lucky and found an old fuse holder
assembly from a GE Progress line radio harness at a hamfest and
converted it. I also put a small power distribution block in
the back with the radios, and each radio has its own correctly
sized fuse as well. None of the grounds are fused.

I've seen the results of vehicle electrical fires, and have
a healthy respect for the power contained in a lead acid battery.

Words to the wise, I'd say...

Robert,

I believe the main advantage of the dsp-9 is that it actually
removes noise, as opposd to the rs dsp-40 which achieves better noise
figures by digital compression/limiting. This is a BIG difference,
resulting in you hearing less noise on te dsp-9, as opposed to a spectrum
analyzer
hearing less noise on the dsp-40.

The new 9+ is the next target of my piggy-bank/slush fund.

In a lot of other electronic equipment there is a push button or a
reset jumper which just short circuits the lithium battery for a
moment. This should work just as well as desoldering it and will
save wear and tear on the circuit board from the heat although it
will shorten the battery's life by a few days each time you do it.
Hope you get the cause sorted out soon.

R>which is as good or better with the same price and features ?
R>I'm looking for 2 meter transmit with wide band receive including
R>AM aircraft receive.

WELL...take a look at Yaesu's FT-416, also. It's got about the
same feature list, and is bigger, but you get 2.5W at TX. This might be
important if you want to be able to hit repeaters in town a bit harder.
If the diminutive size is important, get the FT-11. Size and power
with battery is about the only difference between the two. At any rate,
I never met a Yaesu I didn't like...

From: hamilton@BIX.com
Message-ID: <hamilton.772822046@BIX.com>
Source record: 225909

I just bought a very nice IC-2SRA thru rec.radio.swap but of course it came -- just as it does from Icom -- with only a single BP-84 battery and trickle charger.

I notice there are quite a number of ads in QST and elsewhere from vendors offering after-market batteries and chargers, so I'm curious to hear opinions on how much one can really save by going that route and whether it's worth it.

Do the batteries really look cosmetically just like the originals from Icom? Anyone who feels quite strongly that one supplier is better/cheaper than another?

I see a number of vendors offer rapid chargers, but neither the one offered by Icom nor the others I see advertized mention they provide an optional conditioning cycle as I have on the rapid charger for my Oki cellular phone. Have I missed something? Does anyone offer a charger with that feature (or is there a reason why not)?

Also, I notice there are folks listed in, e.g., the HRO catalog that offer big shoulder-strapped sealed lead-acid batteries with really large capacity (well, compared to a regular NiCd). Anyone bought one and got some opinions? They look kind of neat but I suspect the weight might get old pretty quick...

>pack profits than the radio.
>

The Yaesu AA holders will not charge through the radio. It is missing the
3rd charging contact. Your conjecture about protecting profits is probably
partly true, but there is the issue of internal shorts, which I have
addressed earlier. Has to do with the insulation on NiCds wearing off
after repeated use. The cells can short -- happened to me. Nothing
bad happened since I did catch it in time, but I can see how the
corporate lawyers would want to put a warning in big letters.

I have both the mics for my 2SRA. I bought the big one for better audio, but
later realized only the small one had a built-in earphone jack (go figure).
Since I was going to use it in a noisy environment, I got the small one. For
bicycle mobile, I'd go with the small one.

I have a TNR pack for my 2SRA and the shape is identical, but the plastic
color is just slightly different (not as deep black). Not a big deal unless
you are anal-retentive about that sort of thing.

2476. Ramsey's catalog (John Ramsey?)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-28 19:45:32 UTC
From: gganderson@augustana.edu
Message-ID: <gganderson.473.0@augustana.edu>
Source record: 225897

I would like to get Ramsey's catalog. What do I need to send
(SASE? postage?)? Where do I need to send?

I know that Ramsey kits have received very mixed reviews,
but nonetheless I would like to see the catalog. Thanks!

You did't say what accessories come with it, or if it's a black or silver unit. I am however, interested. How radio related does the trade have to be? All I've got right now is PC stuff.

If they do, I hope that:
1) It's a mobile with some decent power...
and 2) That it has more modes than just USB and CW (Unlike the
stupid htx-100 I have...) AM, FM, and repeater offsets,
ctcss tones, etc. would be a good idea too...

If it doesn't have at least that, I'll be avoiding it...

>460MHZ?

Unfortunately, it leaves off at 459.995, from the factory. My interest is, naturally, in ranges above. I have heard that the firmware, as well as receiver design is quite similar to the TH78 which has the coverage I'd like to see.

There is a set of diodes/ zero ohm smd devices in the control head that don't appear on the schematic; no doubt this is where any mods will take place but I'm a bit chicken to start removing jumpers (or adding, in the case of some mysterious blank pads), without knowing what I'm doing. Also, no doubt, like the TH78, there's some front panel button pushing to be done for proper operation.

Cheers,

John Hall

From: rpinder@hsc.usc.edu
Message-ID: <2uqffl$aiv@hsc.usc.edu>
Source record: 225906

Being newly licensed (and waiting) and with VERY limited funds (if I want to keep the marriage) I've been considering starting out with a dedicated 6 meter system, probably something used.....

I've heard of an older piece of hardware called an Icom 551 - I think it has a fair amount of power, and has the potential for an installed tone board to make repeater work possible.

Has anyone had good luck with this radio? Do you think it's still a viable radio, and worthy of a look? Any guesses on approximate price for a used one???

I'd also consider less power - probably would be happy with as little as 25 watts..... any other suggestions would be good. I've seen some nice looking multi band new ones right around the $2k mark, and I decided to look the other way!

thanks for your help...

2487. Opinions About Ft11r Handheld ?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-29 01:28:00 UTC
From: David.Edger@f239.n109.z1.fidonet.org
Message-ID: <e9c_9406282103@blkcat.fidonet.org>
Source record: 225912

The FTllR is a great little rig, but it has some defects that
might be important to you. First, it is expensive to obtain the 12V
converter to allow its use in a car. Second, I find the construction
to be a little less solid than some of the other rigs. Finally, CTCSS
decode is an extra cost option.
The above said, it is a nice radio. But, if I was buying new, I
would definitely look closely at the Icom T21A. This radio has none of
the defects of the FTllR. It has, as an added attraction, 6W output
when run from a 12V supply, PL tone scan which is really nifty, and
most importantly UHF receive capability from 400 to 490 MHZ. This last
is lots of fun and lets you do a bit of scanning when the 2 meter
repeaters are quiet.
The T21A is more expensive, but it has a lot to offer.

I just received my battery and charger from W & W Associates, and I've got mixed reactions after testing them.

The charger (Mastercharger I) is excellent! It seems to do all the right things, and it charges my Yaesu FNB-25 in about 30 minutes. It's based on the Phillips TEA1100 battery charger controller IC, which seems to be a smart piece of work. It's a true Delta-V charger with both fast charge and trickle states.

The Mastercharger I is $85, comes with a 15vdc 1A power pack, and can run on unregulated 12v as well. It charges any nicad pack from 6 to 13 volts. You get to pick one drop-in adapter cup with the charger and extras (for other kinds of batteries) are $16, but they would be a pain to switch (4 screws). I mounted a new external connector on mine, and run my own leads out to all kinds of other batteries. So far, no complaints.

I also bought one of their extended FNB-27(S) 12v 800mah batteries, but I can't say much good about it. It does have the standard micro phono charge input connector, unlike some other 3rd party batteries, but I will probably never use that anyway.

The physical fit is inferior to the Yaesu batteries. It's a bit snug in the radio, and the seams just don't line up nicely. I am being picky here, but if I had my pick, I would prefer the Yaesu case.

Also, the 800mah rating is a bit generous, if not deceitful. I put a fixed 117 ohm load on it and recorded the voltage over several hours. It went from full resting charge (13v) down to 5.5v over a period of 419 minutes. The curve shape was normal for a new nicad pack (12.0v at 352 minutes, downhill from there.)

My question is HOW do they rate the mAh of a battery? I called W&W and they said that they don't at all. They just copy the "800 mah" rating that Sanyo gives them on the cells. I'm not impressed.

If I take each measurement sample (1/2 second steps), measure the voltage, compute the current based on 117 ohms, and multiply the amps, volts, and fraction of an hour, I get a sum total of 8.88205 VAhr under the curve (before it drops to 5.5v). I use 5.5v because that's where my FT-530 shuts itself off. I consider the battery dead before then.

Dividing by 8.88205 VAhr by 12.0v gives a total of .7402 Ah, which is less than the rated 800 mAh. In reality, I would say "much less", since the battery is probably useless for transmitting as soon as it can't support a load. (117 ohms isn't much of a load.)

Compare this to the Yaesu FNB-25 (7.2v 600 mah). It ran for 626 minutes before dropping to 5.5v (lower voltage, less current). Using the same area-under-curve computations, I get 4.882 VAhr, which is 678 mah at 7.2v. This is what I might expect from a new battery pack.

So, when they rate "mah", do they count every last morsel of electricity, right down to 0v? I don't think there's much there to count, but I certainly don't intend to reverse-charge any cells by running them that far down.

I have some PostScript plots of the discharge curves, if there's any interest. It's really remarkable to see the sharp knee of nicad death. Even more interesting is the discharge plot for an old "worn out" 7.2v battery. It takes a 1.2v dive very early in the discharge cycle, probably due to one weak cell. That cell is then reverse-charging for the rest of the discharge, which probably does wonders for it's degradation. Each cell then dies in turn, with a well-defined 1.2v step down. A new battery has all the steps at about the same time, while old ones seem to space them out. Neat stuff to see!

I'm now wondering if running the 12v pack down to 5.5v isn't somewhat damaging, since many of the cells have long since died and reversed by the time it gets there. I would imagine that the very first cell to go will be the first one to eventually get destroyed by the others. Makes me wish they built in a way to discharge each cell individually for conditioning.

Oh, here's part of a news posting I put up a week ago about W&W and Periphix with the company info in it. Have fun.

Happy Hacking!

----------8<----------8<----- CUT HERE -----8<----------8<----------

I'm expecting a package soon from W & W Associates, who also sell Ni-Cad packs and custom chargers. I wanted to shop Periphex, but they took two months to send me a catalog, and their prices aren't as good. Now that I have it, I'm surprised to see that they only resell Yaesu standard chargers, not their own. (NC-42 for $99) I'm not impressed, but I'm only looking at Yaesu stuff right now, so other brands may be better served. Their max batteries for the FT-530 are 7.2v 1400mah and 12v 800mah, each listed at $65.

W&W has a promising gizmo they call the Mastercharger I, which is some kind of smart ("Phillips Microprocessor") high-speed Delta-V charger good for any Ni-Cad from 6 to 13.2 volts. It takes adapter "cups" to charge most types of HT batteries, but extras cost $16 each. I intend to make my own (unusual) wiring adapters since it looks like the charger output plug is pretty standard. The charger with one cup is $85. Cigarette-lighter power cord is $10. (I don't know if it does more than just pass 12v power, since the charger can do 13.2v batteries.)

They had 12v 800mah and 7.2v 1500mah oversized batteries for my FT-530, each $49, which seems to be an excellent price.

I haven't received anything yet, so I can't comment on how well they meet their advertised spec, or how nice the charger is.

2490. BNC Ethernet terminator as HT dummy load?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-29 06:35:26 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Jun28233526@susie.vigra.com>
Source record: 225918

Has anyone tried using a 50ohm BNC Ethernet terminator as a small dummy load for an HT? I've been using one as a sortof protective "end cap" for the antenna connector on my FT-530 during transit, and I'm curious to know if it would hurt anything to accidentally transmit into it.

To my knowledge, it's just a 50ohm resistor. I have no idea what the resistor's current rating is. The HT doesn't put out more than 5 Watts, usually no more than 2.

Anyone try this? It sure is convenient. :-)

They're usually a 1/2 W 50ohm resistor; the older ones I have seem to be carbon based, but the new ones may be made from metal film resistors. They're probably as good or better as a terminator indended for "ham radio use", though the power rating is a bit low. You shouldn't have any trouble with it, unless you fry the resistor by transmitting into it for too long/too much power.

Also you can use the rubber dummy load that came in the box with the radio; It was very nice of the company to include one! Hi Hi. (I have a 530 also, and mine came with the "original" style short ant; not the ft-470 type; and that was a really dummy load ;-)

Enjoy es 73!

I'm in the process of looking for a truck. I have a Ford Bronco II which has horrible RF interference in it. The only Ford truck I am considering is a Turbo-Diesel (due to the RF interference and Ford attitude toward it).

I know that there (hopefully) will be no interference from the engine, but will there be, or has anyone experienced, any interference from anything else, specifically the tach? On the Bronco II, aside from the fuel pump, the majority of the interference comes from the 600v tach pulse in the wiring harness.

Any thought/experiences will be greatly appreciated.

>Has anyone tried using a 50ohm BNC Ethernet terminator as a small
>dummy load for an HT?

YES I have tried it and it works. I checked the swr on it and it was 1.1
not bad. I also tried a 72/75 ohm terminator also (I found a bunch being thrown
out from old network) and the swr was about 1.5. I tried it at 5w for about
2 minutes and it did get a bit warm, but not hot.

Lets try one on a 50w amp and see if it can melt its own solder?!!

Well, you want to stop when the cells get to 1.0V each, or 12V
for the pack. Anything after that and you risk cell reversal.

Unfortunately, Ah ratings are done independent of voltage. An
amp of current is an amp of current, so you want to count electrons,
not VAhr which is energy.

Nevertheless, I'm not surprised at your findings, since it is a new
pack. NiCds need to be cycled a couple of times before you get
full capacity. Most people don't bother, since in regular use,
it will get cycled. But, I would be curious to see what your

results would be if you repeated the experiment. Go to 12.0V only, the rest is bad for your cells. Do what you did, but just integrate current over time, and not worry about the terminal voltage as long as it is above 12.0V. I would guess that the second time you'll get more capacity.

Most delta-V chargers undercharge cells. NiCd chemistry is not very friendly to quick charging. Delta-V chargers will charge a cell to about 85 to 90 percent of full charge.
Delta-V chargers stop charging when the charge current starts oxygen production at the positive plate. This causes heating, which in turn reduces the polarization at the positive plate, lowering the terminal voltage, and the triggering delta-V.
To get the last 10 percent of the charge, you need to charge the cell until the terminal voltage reaches 1.6V in order to fully charge the positive plate. Unfortunately, at 1.6V, most of the current is going to produce oxygen at the positive terminal, and if it is done at too high a current, it will cause damage to the cell. So, you need to run the delta-V charger, then trickle charge for a while, say 3 hours at 0.1C or 80 mA in your case. Then test.

I suspect they are using Sanyo KR800-AAE cells. Those are good cells, and will supply their rated capacity if cycled a couple times and charged fully. Most manufacturers rate the cells when charged using the standard method, or 0.1C for 14-16 hours at 20C. NiCd charge efficiency drops off rapidly at higher temperatures.

Good luck and good post.

All that it is is a low wattage dummy load. maybe 1/2 watt. If your HT
got stuck on transmitting, it probably eventually overheat. If you can
get it apart, maybe some heat sink goop might boost its power rating.
If you can keep the goop from leaking out!

Source record: 225934

That was my thought as well. But, there is some good news, I think...

Just contacted a local dealer, and they indicated this was a known problem with some of the earlier models of the 742, and Kenwood does have a fix for it - apparently, some of the symptoms of the problem are:

* Lockups such as the one I described

* Occasional changing of settings when the mic RC is turned on

* Fast clock

* Other miscellaneous odd things happening during operation.

I'm glad I checked - it's still about 15 days into the warranty. :-)

Thanks for the suggestions!

>I'd like to see.

Oops... it actually covers 410-470, which is nice for a start. But
I was hoping to cover a *ahem* slightly higher band as the TH78 does
so nicely.

Also, the upper 200 Mhz band would be nice to pick up UHF aircraft; the
radio is smart enough to shift to AM mode in the VHF aircraft band but
you can also toggle the mode manually and store that along with the
frequency in memory.

Cheers,

John Hall

A friend of mine bought a Kenwood TS-850S HF Tranciever at the end of last November (1993). He passed his Technician license last Sseptember but it was lost by the FCC so he had to retake the exam (he lost his part too) and didn't end up getting his ticket until a few weeks ago. In that period of time the rig has just sat in a locked cabinet and has only been fired up twice (for TX) besides a little listening from time to time (he let me make a both of those contacts on it so he could see things in action). He also has the PS-52 Heavy Duty matching Power Supply to go along with it and the SW-2100 2Kw SWR Power meter from Kenwood as well. All of these things were purchased brand new and includes the original packaging and manuals. They are in BRAND NEW Condition. He is selling it because his Dad (who actually purchased it in anticipation of his own license and was loaning it to his son) realized that he needs the money and will reinvest in it in a year or two. I know, I know, it would seem a little short sighted but thats his decision. This Rig is an excellent rig (I own one too!). He is asking the following:

TS-850S HF Tranciever (No Internal Antenna Tuner
but can be added easily as an option) $1250
PS-52 Heavy Duty Matching Power Supply $230
SW-2100 2Kw SWR/Power Meter (Kenwood) $120

He would Like to sell it locally (in order to avoid shipping charges) but if the buyer would pay for the frieght other arrangements could be made.

Please contact me by email if interested or by phone.

My phone number is (801) 371-2301. If not there PLEASE leave a message. Again, you can contact me by email as well.

I usually fuse the ground at the battery too... The reason? If you have a
battery ground wire fail (the bolt falls out..etc.) The truck tries to ground
itself through the radio.. Instant smoked radio!

I have just been notified that I was asleep at the wheel. The
battery in question is a 10-cell (12.0V) and thus, you want to stop
when it goes to 10.0V, not 12.0V. Whoops!

>

Same problem. Substitute 10.0V for 12.0V.
Gotta get a new CPU for the space above the shoulders.

-Ken

p.s. for you electrochemically inclined, the reason you need to charge
to such a high terminal voltage and evolve oxygen at the positive electrode
to achieve full charge is that the equilibrium potential for the
Ni(3+)/Ni(2+) combination is 1.33V ref. hydrogen electrode in KOH, while
it only takes 1.23V to split water. So, in order to run at equilibrium,
you are already getting oxygen evolution. You need an overvoltage to
overcome polarization and kinetic effects.

2510. Yaesu FRG-9600 Mods Wanted

As a service to myself and others using this newsgroup I have kindly
volunteered myself for the following task:

I am interested in getting into VHF packet radio as well as having a VHF rig
I can take in my car. I am a fairly poor graduate student, so I am looking
for the best buy/most features/for low $. (Thats what everyone wants right?!)

I feel that there are others like me that read this newsgroup as well, so,
to conserve bandwidth, I am volunteering to compile the answers to the
following questions and post them back here in this forum for all to read.

So email me your thoughts, flames, kudos, (mobile VHF radios (Hee... Hee...
I am kidding! (message required for the humor impaired :) :) :) etc...
on the following questions and on July 15, I'll compile/summarize your
responses and post them back to the net.

*** I will acknowledge contributers in the summary unless requested not to ***

Questions:

1) Should I totally avoid mobile VHF rigs because they are cursed and evil?

2) Should I bite a bullet and buy a new VHF mobile rig? If so, who do you think
is the best mail order company to buy from?

3) Should I look around for a used rig?

4) Should I buy a used rig from a commercial company like AES?

5) What do you think is the best value VHF mobile rig?

6) What do you think is the best VHF mobile rig?

Thanks for your input and time... Be looking for a response on July 15!

From: hamilton@BIX.com
Message-ID: <hamilton.772940873@BIX.com>
Source record: 225938

File this under, "I'm just curious."

I know all the major vendors like Icom make repeaters, but they aren't usually listed in the various ham catalogs, leading me to suspect (clever fellow that I am :-) that they must be pretty darned expensive.

But how expensive? And are features like voice synthesis (or is it just electronically stored) messages telling the callsign or that you've just timed out the repeater extra-cost add-ons?

I've heard that with only 600KHz difference between input and output, the filtering to allow simultaneous transmit and receive is also quite typically _very_ expensive. One friend tells me that mechanical filters the size of an oil drum are sometimes used!

Some of you, I know, have set up some pretty sophisticated repeaters. Can you share some of your experience, please? What sort of costs were involved? Where'd you buy your equipment and how'd you choose it? How much power are these things typically running? Obviously, location is important, but just how important does it tend to be in practice? What'd you do about coordinating your frequency? Any sort of ole war stories would be most appreciated.

In a previous article, w5robert@blkbox.COM (Robert Wood) says:

>OK, Anyone have comments on the DSP units by
>Timewave, and did QST ever carry a write up on them???
>73's Robert w5robert@blkbox.com

I have a Timewave DSP-9+ and I love it. Unlike the
Radio Shack (albeit less expensive) unit, this random
noise reduction REALLY works! Things are much quieter.
I think the May or June CQ did a review (I can't
remember which month), and the reviewer said the only
strange thing about it was getting used to the sound
of nothingness on CW and then hearing a signal whoop
out of nowhere. As the reviewer said, and I agree,
this makes weak signals sound like s9+. The
bandwidth filters work nicely too, as do the
heterodyne (noise reduction TONE) filters. The
neat thing about the Timewave filters is that you can
use more than one of them at once. For example,
on SSB, you can use noise reduction, heterodyne
zapping (for getting the tuner-uppers, several at a
time even), and bandwidth too...with minimal
DSP-type distortion! I don't work for Timewave,
by the way, just a very very satisfied customer.
I think I'd like to upgrade, though, to their
DSP-59+ unit, which does continuously adjustable
threshholds on the filtering options.

From: Tanvir_Ahmed@transarc.com
Message-ID: <li4WRm6SMUYN1p06py@transarc.com>
Source record: 225939

I have a hand microphone for Kenwood HF rigs in excellent condition (from the days when I used to own Kenwood).

It is available for the asking. Please e-mail me and I will send it to you. You can send me whatever postage stamps you see on the envelope because that what I will have paid to mail man. If I recieve more then I request, I will do e-nee-mee-nee.... :-).

Also because of my SO (who else has the power get away with such darstic restrictions :-), I probably am getting out of ham-radio for few years (I just got rid of my FT1000D) so expect more goodies for free or nominal price in future.

Keep that my Kenwood is better then your Yaesu is better then your Icom war going :-).

Interesting. Maybe he was overstocked?? :-))

>The Standard dualies (so many...) are great rigs, rather pricey and no
>alpha-numerics. But, definitely a toss-up if bucks are not limiting
>your decision. You will be using the rig ALOT, so make a good choice.

The Standards have far better intermod rejection, IMO, then any dual-band
HTs from Alinco, Yaesu or Kenwood. They also appear less suseptible to
desense.

>The Alinco seems to be serviceable, but so many owners bash them
>in these usenet forums that something MUST be up with them. Mostly
>the probs seem to be reliability and intermod rejection.

My Alinco DR600T dual-band mobile has had a few problems. Nothing
too serious though. My Alinco DJ580T has been a FLAWLESS performer.
It does have a bit of an intermod problem when connected to a mobile
whip antenna, but only in certain areas of downtown Milwaukee. I
once had a Kenwood TH28A. It was useless in ALL areas, and that
was with the duck! Terrible intermod problems. If the TH78 is
anything like the TH28, I'd avoid it. Just my $.02. 73.

2519. Yaesu FT-470 Clone?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-06-30 05:44:50 UTC
From: 52@suzie.tccn.com
Message-ID: <2utm4i$4lr@calvin.tccn.com>
Source record: 225942

Greetings again...

Has anyone out there sucessfully done a clone of a 470's memory? I'm looking for any information regarding either dumping the data to another 470, or (preferably) building an interface to dump the memories and settings to a PC. I've seen all of the mod sheets for it, and many people indicate that it can be done, but I've got nothing indicating anyone has been sucessful yet.

Tnx & 73 de Jim

>600 ma-hours? And who distributes them?
>

The current winner is:

Panasonic 900 mAh AA cell,

followed closely by:

Gold Peak GP850AA 850mAh AA cells.

BUT, both of those above are foam electrodes which have
higher internal impedance, and may not perform as well
as sintered plate electrodes under high drain (>1A) conditions.

The champ of sintered plate is:

Sanyo KR-800AAE 800 mAh cells.

Sanyo is in the process of marketing a 950 mAh foam cell.

I don't have distributors in front of me. Try
Alexander Batteries -- try the 1-800-555-1212 directory.

I was looking for a serial port into the '470's processor when I had a '470.
Basically there IS a line from the mike jack (which is actually a three
conductor jack) into the processor if you squint at the schematic long enough.
However a phone call to Yaesu brought a claim that while the hardware
interface is there, the firmware in the radio does not support a clone mode.

FT-530 for sale with the box and all the accessories that come with it. In addition to it, it has the dual band Diamond Antenna that I paid around $20 for extended range.

For newcomers to world of ham, the FT-530 is a dual band 144mhz/440mhz hand held tranciever. It is a good rig.

I have used the rig for about 4 months (until July 1993) and it is in excellent condition. I have done no modification to it. However you can easily modify it for extended coverage if you like to hear who is breaking up with whom on Friday night. I have the mod sheet that was posted here a while ago

I have not kept up with the prices so I am asking $300. If it is too much I am willing to negotiate for current market conditions.

Terms:

COD or personal check. If you think that I have mis-represented in anyway the condition of the rig or you find any fault that I am not aware of it, you may return it and I will refund your money.

If interested, please e-mail me or you may call me at

I bought this at a thrift store. I'va always wanted one. The only qustion
I have is, what is it? Front panel says:

Lotus FM Receiver
From left to right, it has
Audio Alert Switch leds for Pwr, Tx, Rx, Grace, Adj, OK

On back it has from left to right:
DB-25F labeled "from computer", a screw-on connector labeled "Antenna 75
Ohm", and an Ethernet-like port labeled "Data in BNC".

On bottom, it says:

Lotus Information Network Corp
Burlingame, CA
Model No. 109-13011XX
Serial No. M1302620

And it has a sticker that says : "ID# 34052"

It's 6 1/4"W x 1 1/2" H x 9 1/2 " D.

When I hook it up to a serial connection on the computer, the lights flash,
but I don't know what is is / does. Anyone have any ideas?

All pointers appreciated. Mail me and I'll summarize.

Thanks!

dave.

I have seen AA NiH (nickel metal hydride) rechargeable batteries at 1,200 ma-hours in the Tower Hobbies catalog. The NiH batteries are know to have higher capacity, but they are more expensive and must be trickle charged. The catalog did not explicitly say that the NiH batteries were 1,200 ma-hours, but it was implied by their stock number. I know for sure that there exist at least 1,000 ma-hour AA NiHs.

I don't have their phone number just now. If you want it, I will post it tomorrow.

From: jms@col.hp.com
Message-ID: <2uuiup$j7d@hp-col.col.hp.com>
Source record: 225951

Menachem Galatz DC (mgalatz@panix.com) wrote:
: Can anyone compare the pros and cons of the R390A versus the R388?

R-388:

Covers .5 MHz to 30.5 MHz in 30 1 MHz bands.
The frequency readout is a 'slide rule' type on a drum that turns
as you change bands.
Uses the crystal phasing method of selectivity.
Has an IF frequency of 500 KHz.

R-390A:

Covers .5 MHz to 30.5 MHz in 30 1 MHz bands.
Has a mechanical digital reading dial.
Uses mechanical filters for selectivity as well as a selectable
audio filter that goes to 100 Hz.
Has an IF frequency of 455 KHz.
Has provisions for oven heating of the LMO and mixer crystals.

Neither has an audio derived AGC or product detector for better
SSB reception. There was a lot of information printed years ago about
adding those circuits as well as other enhancements one could do, but
I seem to have mis-placed the articles.

I'm sure there are some other differences, but that's all that
comes to mind right now.

Both are excellent radios, though a bit bulky and heavy by today's
standards. Since they are tube type radios, they also use a fair
amount of power and generate some heat. I have an R-388 and 2
R-390A's, although I only have one of the R-390A's working so far.
The other one is left for this next winter's project!

Robert,
It is a very good piece of equipment for the price.
NO! It will not work well with headphone level audio unless you
turn the volume up so loud that it blasts you out when you
unplug the headphone jack. Your FT-1000 should have
an external speaker jack on the back. My FT-890 does.

Are the better 49mhz walkie talkies suitable for car to car
communications when one car follows another?

Seven friends and myself are touring Costa Rica this summer in two rented
Isusu Trooper 4WDs. We were looking for an inexpensive car/car
communication system that we could carry batteries for (rechargable is out).

I have heard differing opinions on this. I would prefer to keep whatever
we need to purchase in the expendable versus the expensive range. Dont
want to buy a nice handheld and lose it down there. Also: any customs
problems bringing these in and out of country?

If anyone wants to sell anything, Im all ears. Thanks in advance.

Message-ID: <1994Jun30.182326.4282@rsg1.er.usgs.gov>
Source record: 225959

Hello,

I am currently a no-code technician but am looking at upgrading. I have started saving up for an HF rig and hope to buy something by year end (or sooner if I can). I want to stick with a newer all band name-brand rig, used is OK. I am currently thinking of the Kenwood TS-450SAT but a good used 440SAT would be OK as well. Any suggestions for comparable Yaesu or ICOM rigs in the same feature/price range (under $1300 or so new)? Is it a good idea to go for the internal antenna tuner? What about the TS-50 or TS-140?

Until I upgrade, I would use it to listen to code as well as international broadcasts. Please don't email with offers to sell your rig as I am not ready (cash in hand) yet. I do have the latest CQ buyers guide and most of the major catalogs - so I am set as far as info. I just am not sure which features should be considered essential. I believe in buying quality because I would hate to get a bad impression of HF operation due to a 'lame' rig. Thanks in advance for any help you can offer. Bye...

BTW - I am not really a newbie as I have been an electronics hobbyist for about 30 years (shortwave, scanners, etc).

> 4) Sell it at the next ham fest
> 5) Anywhere after the transceiver

>Thanks, 73s Tom WB7ASR...

The answer is no.2. Why? The HF transceiver and the 1KW RF amp are active
devices and may not be so linear, so bad freq.s could be generated within
which need filtering out. The 1KW antenna tuner is a passive and (unless you
really mess up) a linear device so what goes in frequency wise should be what
comes out. Also the tuner input offers the filter a 50-75 ohm output load
which may assist the filter's efficiency. No. 3 is not so bad a choice
given resonant 50-75 ohm antenna loads, but if you switch your tuner to
shunt or straight through position you arrive at no. 3 anyway.

73,
C. C. (Clay) Wynn N4AOX

I believe this is a FM broadcast band sub-carrier decoder. At one time
Lotus offered a subscription service which allowed stock quotations to
be received over the air, like you see with a Quotron or similar
system, presumably so you could stuff the data into a spreadsheet.

I don't know if whoever actually distributed the data still does it,
or if the software required is still around, or even if that's of any
use to you, but there's probably SOME sub-carrier data floating
around this device might hack....

Cheers,

John Hall

(2).

Reason:

1) The harmonics come from the amplifier, and it is best
to get rid of them as soon as possible,

2) The REAL reason. Filters are designed to run into
matched loads. The best filters are doubly terminated,
and are designed to be fed with 50 ohms and run into
a 50 ohm load. The output of the TX should be 50 ohms
and the INPUT of the tuner should be 50 ohms.

The path between the antenna and the tuner is resonant
but not with 50 ohm terminations. (If it were, you
wouldn't need a tuner). There could be huge circulating
currents in the feedwire which the filter is not capable
of handling, and the filter will probably not give
the designed filter characteristics when run into a
non 50 ohm load.

Hello

I'm in need of a Tech manual for a Swan 500C I picked up a couple weeks ago at a hamfest.

The one I got with it is for a Swan 500, I can easily tell there different. Anyone have one they'd part with or copy ? I'd be more than happy to pay the costs involved.

I could also use a couple 6LQ6's (Finals) and a 6GK6 driver.

Thanks and 73,

Ron Viegelahn, KE6GLZ

HI all:
I recently purchased an ALINCO DR-600T, and I really like it. But
it has a problem when in crossband repeat, the transmit cuts out. I sent
the radio back to alinco to figure out this problem. THey told me, "That
when it recieves a signal of S-7 or less for x-band repeat RF is fed back
into the recieve." they say this is a design flaw of the radio, and they
could not correct it. They recomended that I get a DUALBAND anteana, and
a DUPLEXER with 60db of isolation between the bands.
Has anyone had this problem?? and if so what can I do about it
without getting rid of the rig, or getting a new anteana system.

Re: Automatic Allocation of HF radio channels

As part of my final year Electrical Engineering thesis project at Monash University in Melbourne, Austrlia, I have undertaken to research into 'Self Tracking Automatic HF Optimisation of Voice and Data'. The project work is on behalf of Melbourne based company, BHP Petroleum that make great use of telecommunication equipment in remote locations both locally and overseas.

The latest equipment I came across that handles automatic allocation of HF channels is the Automatic Link Establishment (ALE) 1045 controller.

I managed to get a copy of a brochure on ALE 1045 detailing its possible arrangement in conjunction with a PC, high speed data modem and an HF radio.

Having also read through the US Federal Standards 1045 on ALE titled 'Telecommunications: Radio Automatic Link Establishment', I would greatly appreciate further information on ALE or relevant equipment and about the possibility of transmitting voice as well as data using this system.

Could someone please clarify the following points:

AA) Is it viable to digitize and compress voice before transmitting it as data blocks but switching off the 'retransmission' mode to prevent echoes? What type of Codec might be suitable for voice digitisation?

BB) Can an ALE system be used to allocate the optimum HF channel at regular intervals and switch over to normal analog voice communication?

Any references to literature or technical articles would also be much appreciated.

Thanking in advance,

Shiraz Iskenderian,
Monash University.

>a little or spend a lot.

I agree. I use a used Motorola commercial repeater, a GAsFET preamp', four element stacked dipoles, duplexers, and a homebrew controller. My net investment was about $500 by being a patient and careful shopper. Of course buying the repeater at a state surplus auction (it was listed as a "paging base station"--except I have a Motorola key) for an absurdly low price helped a lot!

Just like all other equipment in ham radio, you can go plug 'n play (or is that plug and PAY?) or challenge yourself to be creative and resourceful. That's part of the hobby!

I have talked to a local repeater operator. He told me to put up a
first class commercial grade ham radio repeater for 440 MHz band will
cost arount $20,000.00.

2550. JRL-2000FU Mods for 10 Meter Op

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-01 12:32:11 UTC
From: stevel@xetron.com
Message-ID: <stevel-010794083211@tc_mac1.xetron.com>
Source record: 225978

Yet another posting looking for equipment mods.

My father (K8TL) recently purchased a JRC model JRL-2000FU linear for his HF station.
The sales people at JRC claimed that it would work on 10 meters, however it only
works as an antenna tuner at that frequency. A follow up letter with the company still claims that there is no difference between the JRL-2000FU (U.S. Version) and the JRL-2000F (Everybody else) except the power plug.

The amp is microprocessor controlled, and the power amp will not engage above about 24 Mhz. We can probably override the logic level that shuts off the amp, but this may also may the SWR override.

Anybody got any clues? (Or perhaps a dump of the PROM from a 2000F??

>cost arount $20,000.00.

Like anything in ham radio (or any hobby for that matter), you can spend a little or spend a lot. You can put a simple repeater with a very basic controller and split antennas for less than the cost of an HT if you want to do a lot of building and converting on your own, including making antennas. Or, you can spend $10,000 for a new commercial repeater, $1,500 for a duplexer, $800 for a StationMaster, possibly thousands of dollars for good hardline depending on length, $5,000 on a fully-loaded controller with DVR, preamp, patch cables, lightening protection, phone line, power supply, remote base, auxillary antennas, control receivers, link antennas, cavities, on and on and on...

How much does a typical good-quality middle-of-the-road repeater cost? Well, let's break it down. I'll pick 440 for an example, and round off to nearest $100 (2m would cost slightly more due to cost of duplexer).

Start with a good used commercial repeater, like a GE Mastr II: $1,500
10 dB SuperStationmaster Antenna (shipping included): $800
4-cavity duplexer, like a WACOM or Tx/Rx: $600
GaAs FET Preamp: $100
200' of 7/8" hardline w/connectors: $1,100
Good controller, no voices, with autopatch: $400
Patch cables, lightening protection, phone line, other incidentals: $400

A little under $5,000 total. This is an above-average-quality repeater installation, but without any bells and whistles.

Downgrade from a StationMaster to a Diamond, from a commercial repeater to a converted mobile, find a site that doesn't require a long feedline, skip the preamp, and use a mobile duplexer, and you're down to about $2,000 or less.

There is always somewhere to cut corners - it's just a question of how much you want to spend and what kind of performance and reliability you want to pay for.

>darned expensive.

If you have to ask..... :-(

A basic commercial repeater runs in the multiple thousands of
dollars. No right thinking ham would ever buy one. There are
much better alternatives. The key requirements for a repeater
are a bulletproof receiver and a thermally solid transmitter.
That describes a $50 GE Exec II or Motorola Micor.

>But how expensive? And are features like voice synthesis (or is
>it just electronically stored) messages telling the callsign or
>that you've just timed out the repeater extra-cost add-ons?

Yes. The Icom, Motorola Radius, and the like, commercial repeaters
have elementary controllers. A more sophisticated controller is
required for these features. Names are ACC, AD/Technologies, etc.
Costs range from $1000-$3000. But such bells and whistles are overkill
for most repeaters. A S-Comm 5k or 7k will likely do all you ever really
need to do, and costs from $175-$300 depending on autopatch and other
features.

>I've heard that with only 600KHz difference between input and output,
>the filtering to allow simultaneous transmit and receive is also
>quite typically _very_ expensive. One friend tells me that mechanical
>filters the size of an oil drum are sometimes used!

At 10 meters they can be that large, but typical cavity sizes are
from Coke can size for UHF to liter Coke bottle size for 2 meters.
Typical duplexers will use 4 or 6 cavities. Note, in specially harsh
RF environments, large pass cavities may also be used. These can be
6 to 12 inches in diameter, and 30-40 inches tall at 2 meters, about
a third that size at 440. Typical manufacturers are Tx-Rx Systems,
DB Products, and Sinclair. New duplexers can run $500-$1000 or more,
but used duplexers are available for much less, in the $75 to $200 range.
Duplexers rarely wear out, so buying used commercial duplexers is very
viable.

>Some of you, I know, have set up some pretty sophisticated repeaters.
>Can you share some of your experience, please? What sort of costs

>were involved? Where'd you buy your equipment and how'd you choose
>it? How much power are these things typically running? Obviously,
>location is important, but just how important does it tend to be
>in practice? What'd you do about coordinating your frequency? Any
>sort of ole war stories would be most appreciated.

Location is *everything* for a repeater. Your height above average terrain will almost completely determine your coverage area. My machine sits 970 feet up a TV broadcast tower. Transmit power isn't very important. You want the repeater to be heard no further than it can hear a mobile on the ground. About 15 watts is all you want to run for a coverage area with a 40-70 mile radius. This makes the 110 watt Exec PA last *forever*.

The main concern with antennas is that they be mechanically rugged to withstand the harsh conditions at altitude. A repeater antenna should also have good gain toward, and slightly below, the horizon. There's no point in wasting power irradiating birds, about 0.5 degree of electrical downtilt in the antenna is desirable. Cellwave and DB Products, and Diamond and Comet, are the names of interest. Costs can range from greater than $500 for the former two down to $124 for a UHF Comet repeater antenna. My machine has had a DB Products (used commercial), a Cushcraft 4-pole (yuck!), and a Comet. The Comet has been up for the last 3 years, surviving the blizzard of 93 with no problems.

A cost breakdown shows I paid $50 for the GE radio (used), $175 for the S-Comm 5k (new), $200 for a 6 cavity DB Products duplexer (used), $85 for a helical cavity filtered GASFET preamp (new), $124 for the Comet antenna (new), $20 for a hamfest special Lambda power supply (much used), and had a Sola constant voltage transformer (used) donated to the project. About 20 feet of RG213 and assorted connectors, some #8 stranded wire, and a couple of other connectors completes the project. It's housed in an existing GE radio cabinet on donated rack panels. The antenna side mount for the tower is homemade out of scrap steel. So the total repeater cost about $700. Spending more money won't get you better coverage or better reliability. I've had to make only *3* trips up the tower to service the machine in the last 2 years.

Surely that *must* include a 300 foot freestanding tower and a transmitter building! No one in their right mind could spend that much on just a repeater.

> 4) Sell it at the next ham fest
> 5) Anywhere after the transceiver

>Thanks, 73s Tom WB7ASR...

>tom_boza@ccm.hf.intel.com

The answer is 1. The reason is as follows:

The transceiver is solid state and thus generates the most harmonics due to non-linear characteristics (this applies to all amplifiers). So if the the filter is between the rig and amp the harmonics from the rig will be attenuated and thus not have any chance to be amplified by the amp.

The second reason is (assuming a tube amp) that the amplifier basically has a matching network on both the input and output of the amplifier, what you are doing when you tune the amplifier is matching the output impedance of the tubes (the amplifier) to the antenna (50 ohms). Since this tuning process has a small operating range (also known as bandwidth) the harmonics never make it out of the amplifier.

Hope this helps.

2557. 213 Linear Amplifer

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-01 21:58:30 UTC
From: pulley@beaver.phys.lsu.edu
Message-ID: <2v23i6$10f5@te6000.otc.lsu.edu>
Source record: 225980

Hello,
I have recently come into what appears to be most of a linear amplifier for multiple bands which uses a single 213 tube. Parts are missing and I am trying to find out if anyone knows of any diagrams in things like the ARRL handbook or CQ or some other such available resource which would describe a similar device. If such a thing exists it may save me some time in trying to figure out what is and is not missing. I have a diagram for an amp which uses 2 213's, but not just one. If anyone knows of such a thing please either respond to me directly at the e-mail address below or reply to this message.
Thanks,
Joe Pulley

I have a IC-W2A and use the HM-70 in XYL's car (there's an IC-229H in my car)
and it works quite well. I don't know if there's a headset mike that would
work with the IC-W2A but for bicycle mobile I'd call ICOM and see if there was.

Depends on what/who you what to protect!

If you want to contain your own harmonics and protect your neighbors etc
from them BY ALL MEANS it must go after the amplifier.

The downside of this is that the insertion loss of the filter will
"eat" a tiny bit of your TX power.

I recently installed a TM-733 in place of a TM-741 that was rendered unusable after my vehicle was broken into (more about which below.)

> The salesman at the local HRO didn't seem to care for the radio
> much. He claims that it suffers from intollerable intermod problems

Alas, this is essentially correct in my experience. Here in the Silicon Valley operating this rig in its "vanilla" receiving mode creates more snap-crackle-pops sounds than a bowl of Kellogg's Rice Crispies. Enabling the advanced intercept point (AIP) circuit helps, as does cranking the squelch up real high, either manually or using the signal level squelch features. Even with all of these features active, hoever, I still can't keep the rig totally quiet in known intermod hot spots (I've finally gotten into the habit of turning the volume controls down a bit whenever I get near the intchange where Highway 280 meets 880.)

> Can anyone comment on how bad intermod is on this unit, compared to
> others like it?

In the same vehicle with the same antenna, my old unmodified TM-741 didn't have anywhere near this much trouble, and only crackled occasionally when in the vicinity of the known hot spots I mentioned above. (I mention that the rig was unmodified because I have heard complaints about some of the common TM-741 mods effecting sensitivity.)

> The big feature that makes this radio look attractive is the
> extra-small detachable face.

This was an important factor to me when I selected this rig. When the thugs broke into my car and ripped off all the audio gear, they also got the dash-mounted control head for my TM-741, although they missed the rig itself, which was mounted under the driver's seat. I decided that I'd sacrifice the 23cm capabilities of the TM-741, replace it with a dual-bander with a fully removable control head, and apply the residual insurance reimbursement to a low-end alarm system.

Why didn't I just replace the control head on the TM-741? Hah -- try it! HRO, from whom I purchased the rig, doesn't deal in "parts", and showed more interest in selling me a new rig than helping me get the old one back in working order. They did, hoever, give me a phone number for Kenwood's parts department. When Kenwood learned that I was neither a retailer nor a

corporate customer, they exhibited even less desire to help than HRO and pointed me to a third-party parts house that services California for them. It was from these folks that I finally got a few answers: (1) no, the head for the TM-742 is not compatible with the TM-741; (2) yes, the TM-741 *is* out of production, and has been since very soon after the TM-742 was introduced; (3) no, Kenwood does not at this time distribute the control head for the TM-741 as a separate component; (4) yes, Kenwood is considering making it available separately; call back in three months and we *might* know something more about this.

I was pretty pissed at Kenwood by this time. After all, the rig was still the top of the line when I bought it, and only fifteen months later I can't replace a major part that is essential to the operation of the radio. Score two black marks against Kenwood in my book.

> The Kenwood glossy says that the face is detachable for security,
> but mentions nothing about remote-mounting it. Do they sell a
> bracket/wire to remote mount the face? Is it still just as
> detachable from the remote mount as from the radio?

Detaching the head from the rig is extremely easy. In fact, I wish my Alping CD player's head were as easy to remove. Kenwood offers several flavors of remote mounting kit (3m head, 4m head/mic, 7m head/mike/battery), each of which provides the same interface as the rig itself, i.e. yes, you can detach the head from the remote mount.

BTW, remoting just the mic is a snap with a standard RJ-45 coupler and a length of 6-wire modular cable. I sure would like to see more vendors using these connectors, possibly even with standardized pinouts. (Naw, it'll never happen....)

It sure would have been nice if Kenwood had seen fit to include a form-fitting storage box for the head to live in when it's not attached to the rig, as is a fairly common practive for audio toys with removable heads. This particular head has lots of little bulgy bits that rotate very easily due to incidental contact with other goodies in, say, a carryting bag; it's important to visually check the position of the volume and squelch controls before reattaching the head, lest you blow out either your speakers or your ears.

> Are there any glaring problems or overlooked features on this
> radio?

There's one problem that afflicts the TM-733 that IMHO also applies to most of the current high-end rigs. The trend these days is for the feature set to become larger at the same time as the packaging becomes smaller. This results in a user interface that depends very heavily on overloaded buttons, i.e. buttons that perform more than one function depending of one of several "shifted" states. In the month and a half since I installed this rig, I have rendered some bit of its functionality unusable (e.g. loss of a band, transmit lock-out, inability to set VFO frequency, etc.) by accidentally pushing the wrong button or sequence of buttons, which is very easy to do while driving. Since I had not voluntarily elected to activate a particular function,

figuring our how to deavtivate it often resulted in an exciting romp through the not-particularly-well-organized documentation for the rig. On a couple of occasions I had to resort to a hard reset to restore full operation, which of course blew away everything I had tediously entered into the channelized memories. Grrrr. Oh well, I guess that's the price of progress, right?

Source record: 225982

In 1987, I bought an ICOM RP-3010 440MHz repeater, Wacom BpBr duplexers, and a (Phelps Dodge labelled) Super Station Master for $1100. That was the best deal I ever got at Dayton.

I bought an ACC RC-85 board for about $1000 (voice & CW messages, autopatch, remote base capability), a GaAsFET pream for $100, a 100W power amp for $500, a 35A Astron power supply for about $200 (okay, WB8RUQ and N8VOE bought that).

We spent about $200 for cabinets, fans and other hardware. $50 for 7/8" heliax connectors, used.

I got 75' of 7/8" heliax from a broadcast engineer friend of mine.

Not counting 4 sections of tower that has been indefinitely borrowed, along with associated materials and harware, I/we have spent somewhere around $3500.

Whew!

Hey, thanks for your reply! That was some useful information. I got three e-mail responses as well, but none from people who owned or used the 733 model. It sounds as if Kenwood may have slipped on the receive end of this one, since people seem to speak highly of their other Kenwood mobile rigs.

I'm really bummed to hear that Kenwood doesn't stand behind their products with good part support. I would expect to be able to service the radio long after 15 months from buying it. I mean, Fixing It is a ham thing!

I have no reason to disbelieve the local HRO guy who first mentioned the serious intermod problem, since he did have new 733A's in stock, and yet he steered me away from them. He gets two brownie points in my book! It sounds like your local HRO guys are a little less clued in to the Service thing.

After seeing your post, and not hearing from anyone else with a 733A, I think I'm going to shop a bit more before plunking down that much cash. Current contenders are:

The Alinco DR-600T, which seems to have a larger detachable face than the 733A but also has full remote DTMF control. Austin's price is lowest again at $579 (+ ~$40 for a remote mount kit). I don't know if I can squeeze that faceplate in, especially since the mic wants to plug into it. The remote DTMF control sounds very interesting. Anyone have one of these?

The Standard C5718DA. This one has the whole control head on the speaker-mike. This may be both good and bad. How heavy/bulky is it? It looks larger than my HT. The nice part is that it saves me from the whole faceplate mounting problem. I have almost no dash space, and I am concerned about theft, so it would be great to throw the only visible part of the radio into the glovebox when I'm not using it. I guess it could hang from some peg on the dash when I'm driving. Austin doesn't stock Standard, and I don't know HRO's price. List is $849. I'd probably want the memory upgrade (200 instead of a paltry 20 VHF + 20 UHF).

I'm also considering stepping down to a single-band Icom IC-281H 2m. The folks at HRO have only good things to say about it's performance, and their price is $369. Austin gets $375. It does have a 440 receive-only band, which gives you crossband repeat. It's 50 Watts, very small, and rather nice looking. The only problem is that I'd have to find a place to mount the whole thing, since the face isn't detachable. Its extra-small size might make it possible to replace

the ashtray with it, though. :-) Right now, I'm considering stashing
the whole radio in the large Saturn glovebox, but that puts the
controls a bit far from the driver.

Are there any other remote-face twin-bands out there that folks would like to
recommend?

Thanks much!
-Steve "Week 10 and waiting..."

In a previous article I asked about a linear amplifier based on a
213 tube. As far as I can tell there never has been such a
thing as a 213. The number is supposed to be 813. If you
missed the first post, I have about 90% of such an amplifier and
was hoping someone could point me to a schematic or something
equivalent that someone may have used once to build such a
thing. I can probably figure out what is missing, but I am
trying to make my life easier. I am not sure such a schematic
exists nor if what I have is built according to those plans, but
I think it is worth a try. So, if you can help me out, thanks.
If not, sorry to spend your time. Reply here or by email to

I do not know what you mean by "operate". If you mean tx and rx, I have never heard of one covering all these services as they must meet different FCC specs. You can find some that will rx all these services however. ICOM makes seperate transceivers for all these services and they are very good quality.

2568. ICOM HT HEADSET

Ne> I have a IC-W2A and use the HM-70 in XYL's car (there's an IC-229H in
Ne> my car) and it works quite well. I don't know if there's a headset
Ne> mike that would work with the IC-W2A but for bicycle mobile I'd call
Ne> ICOM and see if there was.

The HS-60 is a headset made by Icom for the W2A. It is light weight,
and has two "earbuds" and a boom mic. Mine works very well bicycle-
mobile, but I had to carve the foam of my helmet a bit to keep it from
pressing the headband and a few protrusions into my skull. Mine cost
about $65.

The left earbud plays 144, and the right bud plays 440, which is really
handy in keeping things separate. The unit has a PTT switch and a VOX
mounted in its own enclosure, with a belt clip, about 18 inches up the
wire from the plug.

I have had a recurring problem with mine, however. The loop of wire from
the radio to the PTT enclosure keeps getting snagged as I walk by stuff,
and sometimes that breaks a wire off its printed circuit board pad in
the PTT enclosure. There's no serious strain relief on those wires. Its
been easy to open and fix... but a few weeks later I snag it and have to
fix it again.

I've used the MFJ-285W with thw W2A with no problems. I've also
plugged earphones into the 285W and that worked well too. The only
problem I've had is that sometimes the stereo earphone jack seems to
intermittantly key the xmitter.

HA>and whether it's worth it.

HA>Do the batteries really look cosmetically just like the originals
HA>from Icom? Anyone who feels quite strongly that one supplier is
HA>better/cheaper than another?

I bought a 12v 700 mah battery for my Alinco DJ-F1TH at a hamfest from an outfit called W&W (they advertise in QST). The battery pack's looks and fit are identical to the original Alinco, and I saved about $25. So far (almost a year later) I'm very pleased with it.

HA>I see a number of vendors offer rapid chargers, but neither the one
HA>offered by Icom nor the others I see advertized mention they provide
HA>an optional conditioning cycle as I have on the rapid charger for my
HA>Oki cellular phone. Have I missed something? Does anyone offer a
HA>charger with that feature (or is there a reason why not)?

I'm a little leary of quick chargers. I think they can shorten the life of your batt. I assume the purpose of the "conditioning cycle" is to partially discharge the batt before the rapid charge. If you continually discharge and charge the batt, I believe you're wasting some of the batt's useful life. You're better off with two packs: always have one ready to go, and put up with the overnight recharge time.

Tom: You probably don't want to hear this but my observation is that
whatever you buy, it sooner or later won't suit you because (insert your
dissatisfaction here). ALL the modern rigs will suit your stated
interests. All are good radios. The amateur marketplace won't allow a
company that only offers junk, to compete. Further, if a "name-
brand" does make a "dog", they will stand behind it. I am personally
aquainted with amateurs who bought new gear (includung myself) that
had operating faults. In every case, if redress was sought, the fault
was rectified or the radio was simply replaced with a newer, or upgraded
rig at the manufacturers expense. I even had a PA tube (an 8877) in my
linear amplifier that was six years old replaced by EIMAC because they
found that the "welds" on the heater did not meet their quality control
stds. This is an $800 tube. The heater had failed.

You will hear stories about "bum" radios. But if you listen long enough,
you will hear fans that wouldn't have anything BUT the rig others
complained about. A few people (most, in my experience) will complain
about some rig, and simply trade it off, rather than try to deal with

the manufacturer about the alleged defect. How many people have you heard who wouldn't have a (insert some car model here)? And others love their (same model). Radios are the same.

The trouble is, interests change with experience. Most everybody starts out with the most (read that as expensive) that they can afford and has the most "bells and whistles". But, most "bells and whistles" never get used, except as a point of pride of ownership. Ask you friends just how many of the features on THEIR radio that they actually use.

And, with experience, most everybody settles into some part of the hobby that they prefer. Some like to ragchew (just converse with others) either on phone or CW. Some get into ATV (amateur teleivision). Others like packet. And on and on. This hobby has something for everyone.

As to antenna tuners. If your antenna is resonate, you don't need a tuner. I have never owned a tuner, because ALL my antennas ARE resonate. I operate on 80, 40, 20, 15, 10, 2 meters and 70 cms. And I have at least one antenna for each of those bands. All a tuner does is make the radio like (drive) the antenna. It doesn't make a poor antenna good. And your biggest "bang for the buck" is a good antenna. For example, even a modest beam antenna, at a reasonable height, will give you 6 to 9 db of gain. And that works both in send AND receive. An amplifier gives you a bigger output, BUT if you can't hear the other station you can't work him. I commonly work stations that people with compromise antennas can't even hear. Get yourself an antenna handbook and read it. Build or buy something that works. Plan an antenna system. Get it up. You will never be sorry you did.

Follow-up to using a headset while biking. I have found, that instead of cutting some of the foam out of the helmet, I have used velcro to attach my hs-61 head set to my helmet. This allows me to easily swing the mike out of the way, to transfer the headset to my climbing helmet for search and rescue or use it without the helmet.

To attach, I placed two strips of velcro on the rt side of the helmet, and took the mating strips and wove them through the collapsed head set. Then attached the free velcro on both sides of the head set to the helmet.

From: cxn2624@u.cc.utah.edu
Message-ID: <2v7udc$ns5@u.cc.utah.edu>
Source record: 226004

I have a 1990 Honda and will be buying a rig for the car soon. I have read in the past that there have been some problems when putting a radio in the Honda. Has anyone had this problem before and if so, what can be done about it.

Which radio would work well with the Honda? I am looking for a 2 meter with 440 mhz. I already own a dual band HT. I want to put up seperate antenns, one on either side. I am looking for one that would be lip mounted on the side of the trunk, I would go with Laren but the mounts seem huge.

The last thing I would like to do is install another baterary. The one that I now have died ontce when I was just playing the radio. Has anyone tried putting a second one in?

Thanks for all the help you could give in regards to this.

Christian

mitch in mobile, alabama here again...

well, i was trucking down the interstate yesterday (7/3) on cruise
at about 70 mph, and a toyota camry was passing me, when, all of a
sudden !!!***BOOM***!!! ... the drivers side rear door window blew
out... scared the heck out of me... i first thought that someone
had shot at me... so i went about a mile down the road before i
stopped... no evidence that i was shot at (whew!)... but there
was very little glass inside the (now being called...) the exploder...
apparently the pressure differential caused by the car passing me
had caused the window to explode outward... i had the air
conditioner on low, but it was not a hot day, maybe around 800 f...

maybe the glass was defective or improperly stressed... has anyone
else heard of the glass in an explorer exploding???

thanks for any help...

2586. Misc items for sale + freebeies

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-04 20:10:46 UTC
From: Tanvir_Ahmed@transarc.com
Message-ID: <Ei66n6iSMUYN8NvEBq@transarc.com>
Source record: 226013

1. Bencher lowpass filter Model YA-1. No box or instruction (there is't much to it you put your transmitter on one side and antenn on other side, that is). It is rated at 1.5KW continous and 5kw peak. The unit is in very very excellent condition. Have been used for less then a month (I recall purchasing it in June and Using it until July of last year) $25 + Shipping.

2. AEA MorseMatic morse machine. It is not the new superduper model but one of the first one. I purchased it from a hamfest for $50. Haggled it down from $75. I think it is worth the price. It is in very good condition. I have the manuals (they are kind of photocopies as AEA used to do the business). I really think it is very much worht $50. $50 + Shipping.

3. Archer 100 Watt Soldering Gun. I purchased it from Radio Shack and realized that it it not enough for me and went and got a Weller. However it is not bad for light duty work. You can't beat it at the price of abosolutely free. Free + Shipping + Cost of packing box(which can be from $1 - $3).

4. Yaesu MD-1C8 microphone. Mint condition. With box and instruction. Used for 4 months. It cost $110 or so new. It is available if you need for $55 + Shipping .

5. MFJ VHF 144-220 Mhz SWR/WATTMETER. I still have the instruction manual and the unit is in mint condition. It is available free for the asking + whatever shipping charges and inccur.

6. Yaesu YH-2 Headset. Let you use VOX on your FT-530. Kind of sucks and it kept getting of my ears while I jogged. Your milage may vary. However it is hard to argue with because it is available free for the asking + my shipping charges sending it to you.

7. E-DC-5 DC to DC converter. I bought it so I can use my FT-530 using Cigarette Lighter in my car. 12V DC - 6V DC. It is free for the asking. Howerver you pay the mailman fee because it is cheeper for me to throw it out otherwise :-).

8. Autek Research SWR meter. Very excellent condition. There is small black mark during shipping (from the newspaper or something) on the left side. It is being sold over $100 by Auteck. I have misplaced the manual but it is not really needed. You plug the powersuply and XMTR on IN Side and Antenna on Out side and you are done. The manual also can be obtained from Auteck for $5 or so. I found this meter order of magnitude accurate and useful then the

dinky stuff come with your rigs. $50 + Shipping.

9. MJF Delecux Versa Tuner II model MJF-949E. It is in ok shape with some paint chipping on uppper right edge. Have hardly used it and have misplaced its manual. It is fairly straight forward to use but if you have not used antenna tuners before then you have to call MFJ to get a new manual or ask your buddy about it. It is a useful tool if you have real bad antenna situation. It is (was) selling for $140 or so. $55 + Shipping.

10. I have around 150 feet or so of 8X coaxial cable and around 100 or 150 feet of flexweave antenna cable (great for dipoles, etc). I don't know the exact length but above is the size I usually order. It is free for the asking + Shipping.

11. Austin Antenna Ltd's 500C dual band (2m/70cm) antenna in motorola mount. I have found it much better then Diamond antennas in flat country. Its radiation angle is very low. It is a half wave for 70cm and offset fed 1/4 for 2m. Free + Shipping.

TERMS:

For items with price. By COD or Check. If you feel that any item is not in the condition as I have described, just send me back and I will refund your money - shipping. The prices are kind of firm and I have priced them to sell quickly. At this time I won't like to recieve mail saying something "Your Yasesu desk mic for $15 INCLUDING shipping and COD charges". Right. Don't laugh as I have recieved offer like that for my previous post of FT-530. If I could not sell some item, I will respost it with lower price but at this time I will not entertain any bargaining.

For free items I will send you the item and ask you to send me the shipping charges. If it is in the padded envelope, it will be whatever postage stamcps price + .75 for the envelope (envelopes go from $.25 to $1.00 so I kind of make it $.75 because probably I will be using thta size most). If the item is in box, you pay for the box. Also, for free items I will wait for few days if more them one request comes in. Someone pointed out that in my previous post, the people at the west coast were late.

Also for the free items, there is a limit of one item per person. I debated this for a while and I think it is kind of fair deal. These are not meant to set up someones station but to provide some missing item in their shack.

Also for my previous posts, I replied every person who responded to me. In this case there are quite a few items so don't be offended if I can't reply you individually or am a bit late replying anyone.

Happy hamming and I am sure to see you folks on the air again someday in the future.

Tanvir Ahmed

I remember reading something about installing ham equipment in Saturns
before. I will have to try to remember where I read that. As I
remember, installing radios in Saturns can be difficult -especially
through the firewall. You might want to call Saturn too, because as I
remember, Saturn did not recommend installing any ham gear in their cars
and they will void your warrenty if you do. I think it was in QST about
a year ago. I'll have to look back and see if I can't find it. Good
luck -

jms@col.hp.com (Mike Stansberry) writes:

>Menachem Galatz DC (mgalatz@panix.com) wrote:
>: Can anyone compare the pros and cons of the R390A versus the R388?

<elided material>
>R-390A:

>Covers .5 MHz to 30.5 MHz in 30 1 MHz bands.
Covers 0.5MHz to 32MHz in 30 bands of 1MHz each with a dial accuracy on good receivers of 100Hz. (Mine is 300Hz worst case. And it is that bad only because I quit tweaking on it.)
>Has a mechanical digital reading dial.
Correct.
>Uses mechanical filters for selectivity as well as a selectable
Correct.
sorta....:
.1KHz and 1KHz bandwidths use the 2KHz mechanical filter and a single crystal as a narrow band filter together.
The mechanical filters are 2KHz, 4KHz, 8KHz, and 16KHz.
>audio filter that goes to 100 Hz.
Two positions: wide band and 100Hz.
>Has an IF frequency of 455 KHz.
Last IF is 445KHz. Second to last IF is variable tuned 3.5Mhz to 2.5MHz, in that order. For the lower frequencies the 1st IF is 17.5MHz to 25MHz.
>Has provisions for oven heating of the LMO and mixer crystals.
Use it. Things are MUCH more stable that way.

>Neither has an audio derived AGC or product detector for better
>SSB reception. There was a lot of information printed years ago about
>adding those circuits as well as other enhancements one could do, but
>I seem to have mis-placed the articles.
Home brew it. That is what I did. I added a 7360 product detector and hang AGC and a synchronous AM and FM demodulator. I also tweaked it with another mixer so that I could cover an effective (sorta) 10KHz to 500KHz range, not that I have found much of a use for it other than copying Russian trawlers in the 450-500KHz range.
(I also added a pair of external audio filters with 8KHz bandwidth (plus 10KHz notch) and 3.5KHz with 5KHz notch respectively. They work wonders for weak signal work.)
(BTW - both the line and the local audio outputs are 600 ohm source impedances. Either use phones, true 600 ohm speakers, or add a matching transformer to your normal speaker. They made this 600 ohms output impedance with a clever use of positive and negative feedbacks on the audio amplifier.)

>I'm sure there are some other differences, but that's all that
>comes to mind right now.

>Both are excellent radios, though a bit bulky and heavy by today's
>standards. Since they are tube type radios, they also use a fair
>amount of power and generate some heat. I have an R-388 and 2
>R-390A's, although I only have one of the R-390A's working so far.
>The other one is left for this next winter's project!

>Mike, K0TER

The R-390A I have is a VERY good receiver. The only thing I would add to it at this date is a quality noise blanker. It is remarkably sensitive and for a vacuum tube set remarkably insensitive to intermodulation in actual use. I like mine enough I just spent several days reworking some of my ancient mods and renovating it to proper service. (It was a PAIN to get the VFO working. It had started sticking very badly. I had to open it all the way up and use a quality oil veru judiciously to get it back running properly free. Then the endpoint adjust slug screw lost its head. So I had to develop an external tweaker inductor to bring the endpoints into range. (The range was 4KHz too small. So it proved possible to tweak using external terminals. <phew!>) I like it.

R-388 is not worth a fraction of the cost of a good R-390A. An R-390 is a decent radio. But the difference between it and an R-390A is worth it. The R-392 is a mobile stripped down version of the R-390 series. It is "OK".

All is IMHO of course.

2594. Supressing fuel pump noise in HONDA ACCORD - ideas?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-05 14:31:22 UTC
From: dgf@netcom.com
Message-ID: <dgfCsH1oA.2AC@netcom.com>
Source record: 226021

I'm sure this has been discussed before, however, I didn't save any of the discussion postings. After much persuasion, I got a friend of mine to agree to install HF mobile in his Honda. The installation was quite easy and works pretty well except for fuel pump hash. Before we try to re-invent the wheel, has someone had experience in fuel pump noise supression?

2596. Yaseu FT101-ZD FOR SALE

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-05 18:26:00 UTC
From: sms8445@zeus.tamu.edu
Message-ID: <5JUL199413263735@zeus.tamu.edu>
Source record: 226023

I have a Yaseu FT101-ZD for sale. It is an HF transciever that does CW, and SSB. I have the microphone, straight key, and an antenna tuner to go with it. It has a built in power supply.

It covers all the HF bands and does have a digital display (some of the 101 didn't)

All the above cost me approx. $800 about two years ago. I will take any resonable offer for the equipment.

email me at sms8445@zeus.tamu.edu

2597. ********** Kenwood TH-28A for sale. **********

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-05 19:33:17 UTC
From: wplee@galaxy.csc.calpoly.edu
Message-ID: <1994Jul05.193317.16987@rat.csc.calpoly.edu>
Source record: 226024

Hi,

I like to sell my Kenwood TH-28A + ME-1 for $295.00/obo + half COD shipping.
Its about 8 months old and in excellent shape with all the box and manual.
I have no problems whatsoever and I'm selling this one because I got a dual
band HT a while back. There are three very small (<0.1" if that matters)
scratches but it has never been dropped or banged. I beleive HRO is selling
it for $300.00 and ME-1 for $39.00. I paid $350.00 new and still have the
receipt.
E-mail me or call me if you are interested.

Some of the specs are --
- 2M HT with 5W max. output
- Rx - 118 - 135.987
136 - 173.995
340 - 399.987
400 - 519.975
- Tx - 142 - 151.995
- 40 - memory channel
(240 - memory channel wiht ME-1)
- Alphanumeric memory channel display
- Auto repeater offset
and more good stuff....

thanks,

winston.

I had success with a snap-on ferrite filter from Radio Shack. I snapped
it around the cable from the gas tank where it entered the rear trunk area.

2599. IC-2410H Xmit Audio Boost

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-05 20:37:25 UTC
From: randster@bga.com
Message-ID: <2vcga5$9r6@edwin.bga.com>
Source record: 226025
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Can anyone help with boosting the audio output from the HM-56 microphone on my IC-2410H? I get low audio reports on the repeaters around town (Austin). I opened the cover, but only saw R16 and R19, with no indication of how the gain might be boosted. They are apparently only surface mount fixed resistors. Is there some adjustment that is located under the PCB? I am reluctant to tear into the other side of the PCB unless there is some assurance that there's a good reason to.

I'd like to hear from someone who has had experence with adjusting the audio output from the HM-56 mike.

Thanks + 73
Randy

2600. Best linear for scientific experiment

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-05 21:42:15 UTC
From: Winfield Hill <hill@rowland.org>
Message-ID: <2vclnl$pg4@nmr-z.mgh.harvard.edu>
Source record: 226027
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

I need your advice on a good transmitter for a physic experiment I'm working on.... Thanks in advance for any help. First some background:

Ham transmitters can be very useful in molecular physics experiments. For example, working on a cold-atom trapping experiment, I was able to get a 2000V 4MHz electric field on a wire, by using an old tube kw linear. I used a 50-to-12 ohm balun, plus a homemade 12-ohm non-inductive resistor and air-tuning coil, and was able to get the electric field across a 100pF load, with under 250W from the amplifier.

Now I'd like to make a more reliable and permanent setup. I'm looking for suggestions on the best brand/model of linear amplifier to buy for another experiment.

My primary criteria is that the transmitter amplifier be easy to modify! This is because I'll be working at 1.0 MHz, and also want very fast rise/fall times (a few microseconds, which means reduceing the tank Q). If you have an amplifier you're happy with, then look inside and see how accessible the pieces are, and guess as to its applicability for my strange needs! Better yet, if you've had good results and a happy experience modifying a certain amplifier model, please let me know!

Incidentally, my RF energy stays in a coax cable and thence to a stainless-stell vaccuum chamber, so meeting FCC rules isn't an issue.

P.S. Although I'm an experienced electronics engineer (incl low-power rf), I'm not a ham, and have only nominal experience with ham gear, brands, etc.

2601. JPS NTR-1 for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-05 22:32:07 UTC
From: ira@src.dec.com
Message-ID: <2vcn17$f3i@src-news.pa.dec.com>
Source record: 226028

For sale:

JPS NTR-1 noise/tone reducer. $100 firm, includes shipping as below.

This DSP noise reduction system lists for $169.95 and includes the manufacturers 12V external power supply ($16.00). Total list price was $185.95

This unit is 3 months old and in like-new condition. Includes all manufacturer's original boxes, instruction booklet, warranty card, and 12V power supply. Price is $100.00 firm. I'll pay 1st class US postal shipping to any location in the lower 48 states. Price refunded if condition not as described.

Works fine. I would just prefer to put the money towards a new radio, rather than a quieter radio.

Reply via email (ira@pa.dec.com) or call 415-853-2160.

Regards,
Ira

2602. Re: Kenwood TM742A problem

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-05 23:49:15 UTC
From: garym@alsys.com
Message-ID: <CsHrI3.1s2@alsys.com>
Source record: 226029

In <2uobhs$g14@calvin.tccn.com> 52@suzie.tccn.com (Jim S. Henderson) writes:
>About a year ago, I had just finished the installation of the radio in my

>... when all of a sudden, the rig
>completely locked up - wouldn't accept input or anything, and about 30 seconds
>later, it shut itself down.

>I sent the radio back to the dealer, and they performed a hardware processor
>reset - disconnecting the lithium battery, and reconnecting it (the darn thing
>is *soldered* to the board, of all things...).

This sounds just like one of two known problems outlined in Service
Bulletin ASB-1033, Nov 29, 1993.

The problems detailed are:
(1) Microprocessor lock-up when using S-meter squelch,
(2) Problems with storage/recall of PL tones 203.5 and/or 114.8,
(3) Problems with no transmit on UHF during remote control operation.

These are all fixed by the changes specified in the Service Bulletin. Take
it back to your dealer and insist that they send it back to the Kenwood
service center for this fix. They must replace both microprocessors.

While the SB lists certain serial number ranges that have the problem, it
appears that the problem is not limited to those serial numbers. We just
found one with a "good" serial number but which exhibits the lock-up problem.

Our local RACES group has at least 7 of these radios that exhibited this
problem, including my own personal 742A. Which is going to be boxed up
tonight to be sent in for repair.

If you want to reset the radio yourself (without unsoldering the lithium
battery), it will reset if you remove the PL decoder board, and power it up.
If you don't have the PL decode option, remove the third band module, power
it up and it should then be OK again. Resetting the CPU doesn't fix the
problem, however, it just lets use you the radio until you can get the CPU's
replaced. If you do this, be sure to avoid using S-meter squelch and remote
control operation with a third band module installed, since it will just
lock-up again.

Source record: 226032

I'm heading for my nearest HRO tomorrow afternoon, and plan on comming back with a new mobile 2m / 70cm rig. I've narrowed it down to several choices based on what I've read in their catalog, and I would like input or opinions from folks who have any of these radios, or know of others with comperable features in the same $$$ range (700-800)

1) Alinco DR-600T - I like the feature list as well as the looks of the radio. Cross band and remote control sounds good too! The catalog also says it can RX down to 118.00 which I like.

2) Kenwood TM-733A - Again, nice feature set, tho it the catalog doesn't talk about extended receive range. I've read some negative posts dealing with intermod problems and service and parts problems when dealing with Kenwood though. Control panel looks kinda boring!

3) Yaesu FT-5200 - Another good looking rig with many features, but it doesn't appear to allow RX down to 118.

Right now, I'm leaning towards the Alinco based on features, looks, and price. I like lots of buttons, knobs, and dials, and complicated user interfaces don't bother me (I read the manuals!) If you have any recommendations on these or any other rigs in their class, please reply via email.

Thanks!

... unless you have multiple receive sites. If so, you will need
enough power at your transmission site that you can hear it for as far
away as your furthest receive site can hear a mobile on the ground.
Here in Chicago, WAFAR at 146.67 has six auxilliary receive sites;
they put out 250 W at their transmission site.

I've become very curious about why people purchase dual-band rigs.
From my point of view, a HT should be an efficient communications
device. And yet, people insist on buying these wideband-RX
gadgets that get swamped with intermod if you look at them cross-eyed,
have receivers that are noticably less sensitive than even cheap
single-banders, have low output power and battery capacity, and
become unusable if you try to attach an external antenna to them.

Or is the ability to communicate no longer a priority with
amateur radio operators? :-)

After I passed my no code tech, I went shopping too. All the dual band radios are very very good. The coupons can really make the decision even harder since they can even out the pricing. I chose the Icom ICW21AT because it felt good in my hand. People always comment on the clarity of my transmissions and I have been able to hit repeaters here in the Seattle area on low wattage with good quieting. Also, Icom's headquarters anbd repair shop are 10 miles away if I need them. They all have good features. When I win the lotto I'll buy one of each.

Ne> Thanks + 73
Ne> Randy
Ne> kj5vb

Hi, Randy. Every 2410 in Raleigh had that problem as well. When I bought mine, I was aware of it, and told the dealer I wanted the radio, but only if the audio could be improved. It was low, and tinny.

Communications Headquarters in Wilmington NC talked to Icom, and the best they could do was give me a new microphone -- an HM-14. It sounds decent. More volume, and better fidelity (but doesn't have the touch-tone memories).

It sure seems Icom could design and build a radio that sounds good. Maybe the new 2700 will be better. And maybe they'll give you a new mic, too.

We went back and grounded the antenna (trunk-lip) to one of the trunk support arms, and grounded the rig itself to the firewall; this greatly reduced the level of the noise (by 20 dB or so), but makes the minimum SWR higher. He (the owner) was going to try capacitance between base of antenna & ground (this has worked for me several times in the past). Thanx for the tip on the ferrite filter; this will help more I'm sure. Dave

2615. TS440S/AT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-06 14:25:25 UTC
From: pasek001@maroon.tc.umn.edu
Message-ID: <44277.pasek001@maroon.tc.umn.edu>
Source record: 226040

I just purchased a used Kenwood TS-440S with the built in antenna tuner and
am looking the following information:

Are there any Servive Bulletins out for this rig? If so, could I get
a copy or at least the numbers?

When I got the rig it came with the TS440S owners manual. Did the
internal Antenna tuner have it's own manual? There is minimal
information on it in the owners manual, and it took me a while to find
out that the CW carrier has to be turned up for it to work. If there
was a separate manual for it, could I get a copy?

Finally, I would like to put together a RS232 to TTL interface to use
the computer control. I'm looking for articles from QST, 73, ect.
that describe the interface and samples of the control programing. I
am aware of the UART and 4040 that need to go into the rig, and I have
built a interface for a YEASU FT747GX in the past as well writing some
software to go with it, but the basis for it was the articles from
various magazines.

Well thats about it for now. Any help you may be able to give will be
greatly appreciated. If you have the information and could send me a copy
I'll be more than happy to cover the cost of copying/postage. If you have
suggestions where to look, I'll take that also.

73's & Thanks

From: Greg Smith <greg.n.smith@daytonoh.ncr.com>
Message-ID: <Csly4n.1KD@whq2-top.DaytonOH.NCR.COM>
Source record: 226044

I am completely new to this area (I haven't taken my no-code FCC exam yet) but I am starting to look at 2-metre handhelds for emergency backcountry use. I have heard people speak of an ICOM unit that will do commercial and SAR frequencies.

Any advice on makes, models, acceptable price range, places to buy in the Dayton, OH area?

E-mail appreciated.
Thanks much.

Hey guys,

Do you recall how you get the FT-470 to scan out of the normal ham frequencies?
I think it was a combination of holding some buttons down while powering on,
but I don't remember for sure.

Yeah, yeah, I'll write it down this time!

Thanks,
Cecil N7LTD

Todd Jonz (tcj@infoseek.com) wrote:
: Alas, this is essentially correct in my experience. Here in the Silicon
: Valley operating this rig in its "vanilla" receiving mode creates more
: snap-crackle-pops sounds than a bowl of Kellogg's Rice Crispies. Enabling the
: advanced intercept point (AIP) circuit helps, as does cranking the squelch up
: real high, either manually or using the signal level squelch features. Even
: with all of these features active, hoever, I still can't keep the rig totally
: quiet in known intermod hot spots (I've finally gotten into the habit of
: turning the volume controls down a bit whenever I get near the intchange where
: Highway 280 meets 880.)

Interesting. The 733 was obviously introduced to recover from the
receiver problems that the 732 has. There ads emphasize the "intermod"
performance of the 733. Do you know what the AIP circuit really does?
I assume that its more sophisticated that just an attenuator but I don'
know. Does the receive sensitivity change noticeably when its activated?

<snip>

: Why didn't I just replace the control head on the TM-741? Hah -- try it!
: HRO, from whom I purchased the rig, doesn't deal in "parts", and showed more
: interest in selling me a new rig than helping me get the old one back in
: working order. They did, hoever, give me a phone number for Kenwood's parts
: department. When Kenwood learned that I was neither a retailer nor a
: corporate customer, they exhibited even less desire to help than HRO and
: pointed me to a third-party parts house that services California for them. It
: was from these folks that I finally got a few answers: (1) no, the head for
: the TM-742 is not compatible with the TM-741; (2) yes, the TM-741 *is* out of
: production, and has been since very soon after the TM-742 was introduced; (3)
: no, Kenwood does not at this time distribute the control head for the TM-741
: as a separate component; (4) yes, Kenwood is considering making it available
: separately; call back in three months and we *might* know something more about
: this.

: I was pretty pissed at Kenwood by this time. After all, the rig was still
: the top of the line when I bought it, and only fifteen months later I can't
: replace a major part that is essential to the operation of the radio. Score
: two black marks against Kenwood in my book.

Make sure you send a letter to the Kenwood service center explaining the
situation. You might get some satisfaction this way. (Or maybe not).

I used to own a Yaesu switching power supply. It did not look right to
me to have a 10 lb compact rig when the regular power supply weighed
20lb! The switching one was 3 lb. That power supply worked fine when
all antennas were extrnal. However, with a ceiling antenna or a few
feet of wire all I could here was noise. That was despite extensive
filtering within the unit and a solid steel contruction. I remember
my consternation when, during a presentation at school, all the
children could here was noise! Eventually I traded it to a regular
PS.

Now that my antennas are external again, I wish I had the lightweight
and completely silent PS again.

Do the Timewave DSP's use an algorithm similar to the one described by W9GR in QEX (LMS adaptive filter using short-delay time-shifted input), or is there more to the Timewave noise reduction algorithm?

How about the JPS units - anyone know the algorithms used for white noise reduction and pink noise reduction?

2624. mobile radio eqpt advice for RAAM?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-06 17:16:59 UTC
From: ahw@egret0.Stanford.EDU
Message-ID: <2veoub$erd@nntp2.Stanford.EDU>
Source record: 225850

Hi. I am heading the support crew for a team of 4 cyclists
who are doing Race Across AMerica in the relay division,
starting in Irvine CA on 31 July and finishing in Savannah GA
about 7.5 days (we hope). One rider on the road at all times,
1 at ready, 1 napping, one deep-sleeping; one trailing pace/navigation
vehicle, one RV which will leapfrog the rider/pace in 10-40 miles hops.
Goal #1 is to ensure that a rider moves West->East at every moment.

Our ability as crew to simultaneously support the rider on the
road, prepare the rider-to-be for the exchange, revitalize the
rider-that-was, eat, refill and dump the vehicles, on a 24
hour basis will be at times crucially dependent upon our ability
to communicate between vehicles throughout the southern US path
(soCal-AZ-CO-OK-AR-TN-GA) often out of cellular phone service.

Because the vehicular support comprises multiple vehicles and
the vehicular separation will be at times over 10 miles, we
are led to believe that a simple CB system will be unsatisfactory.

We have neither the time or the inclination to become ham licensees.
There must be something in between; so what is it, who rents it,
does it turn out to be more economical to buy it for a 2 week
purpose and sell it afterward? What typical range will we achieve
in the wide open spaces? What sort of crosstalk problems will we
have? Power supply problems?

I was hoping to hear the voice of experience here before subjecting
myself to sales agents at various local electronics/radio places.
Whatever it is should add a real dimension beyond CBs + cell phones,
for ranges of 10+ miles under the worst of conditions and ~30 miles
on semi-infinite plains.

Ideas? thanks!

2626. Ten-Tec 6m Transverter - Info Wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-06 17:25:42 UTC
From: phb@syseng1.melpar.esys.com
Message-ID: <phb.773515542@melpar>
Source record: 225856

Can anyone answer the following questions regarding the recently-
released (I think) Ten-Tec 6-meter transverter:

1) How much input power will it tolerate from the driving rig?

2) Does it have some type of internal changeover relay or diode
switching scheme to switch between receive and transmit?
Example: Transverter "senses" RF from driver and switches
to transmit mode to protect receive converter. Simultanously,
the antenna is disconnected from the receive converter input
and connected to the transmit converter output.

OR

3) Does the trnsceiver need to have a separate receive input which
is driven by the converter output of the transverter, with only
the antenna connection being switched (and not both the antenna
and the input side)?

OR

4) Does the driving tranceiver need to provide some kind of PTT or
relay switching signal, and perhaps a user-supplied relay?

Thanks in advance, and 73,

There's more. If you just do the above, the audio path is from the speaker
to the microphone and it will pick up nearby sounds as well. Much better is
to take a 3/16" plug that fits the mike jack, and a 1/8" plug for the earphone
jack, wire a 10k resister between the two center pins and plug it in. This
disconnects the speaker and built-in mike and couples the audio from rx to tx.

I believe that 200 W PEP is the legal maximum for 2 meter operation:-O. Does
WAFAR have special permision from the FCC to run 250 W. I suppose this is
possible but I have never heard of it, of course I've only been a HAM for
about a year. Wait a minute, WAFAR doesn't look right. Is WAFAR a special
call or did you leave out a number ie WA#FAR? Just curious.

2631. Beginner's HF Rig for sale $150 + s/h

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-06 18:34:49 UTC
From: jev@tntvax.ntrs.com
Message-ID: <1994Jul6.133449@tntvax>
Source record: 225859

If you are just getting started and want to get on HF with a minimal investment, I have a rig you must look at. It's called a Tempo-One and it was made by Yaesu. Here's a description of the rig:

The Tempo One transceiver for HF amateur bands 80 through 10 meters, is a precision-built high performance tranceiver providing SSB (USB and LSB selectable), CW and AM modes of operation, with a single-tone power of 240W (approx. 300W speech peak input).

High stagbility is obtained by use of a well designed heterodyne VFO, and the specially designed 9 mHz crystal filter ensures good voice quality.

It's compact size, light weight, and attached carrying handle make it very suitable and convenient for both home, portable, and mobile use.

Other features include VOX, 100 kHz calibrator, +/- 5 kHz receiver offset (clarifier) tuning and easy connection for use of a linear amplifier.

Tempo/AC one matching AC power supply with built-in speaker is especially designed for use with the Tranceiver (included).

General Specifications

Modes SSB (USB - LSB), CW, AM
Input Power 240 W
Frequency Range 3.5 - 4; 7 - 7.5; 14 - 14.5; 21 - 21.5;
28 - 30

Antenna Impedance 50 - 100 ohms
Frequency Stability After warm-up, within 100 hz/ every 30 min
Carrier Suppression -40 dB
Sideband Supression -50 dB @ 1000 hz
Third order intermod
products -30 dB (PEP)
A.F. Bandwith 300 - 2700 hz
Receiver Sensitivity 0.5 uV input S/N 10 dB
Selectivity 2.4 kHz(-6dB), 4kHz(-60 dB)
I.F. Interference
ratio 50 dB
Image Ratio 50 dB
Audio Output 1 W @ 10% distortion
Audio Output Impedance 8 ohms
Power Supply AC or DC with separate power supplies
(AC supply included)

Tubes and semiconduct. 16 tubes, 15 diodes, 7 transistors
Dimesions 13 1/4" wide, 5 1/2" high, 11" deep
Weight 17.5 pounds

I will include the original "Single Side Band" microphone by
Turner (mod 454x), which is, itself, quite collectable. It has
never been operated in an area where there has been cigarette
smoke. It makes an excellent starter rig; I've used a Tempo
for over 20 years.

I've checked all tubes with a mutual conductance tester, and
replaced any weak ones. I've peaked the receiver and transmitter,
and both work fine; with very good to excellent reports throughout
the US and Europe. It's yours for $150 plus shipping

2632. Ten-Tec Omni VI information wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-06 18:49:18 UTC
From: watson@wink.corp.sgi.com
Message-ID: <WATSON.94Jul6104918@wink.corp.sgi.com>
Source record: 225855

I'm considering the purchase of an Omni VI.

Is anyone familiar with it willing to send me (or post to this group) their experiences with the Omni VI? I haven't seen a review in QST, but the rig looks good on paper and seemed quite nice when I played with one in Dayton. It would be interesting to hear comparisons against other rigs. Although I use S-Line and Drake TR-7 currently, comparing against the more modern competition would still be very useful.

Is there any truth to the stories of Ten-Tec users becoming fanatical about their rigs over a period of time using them?

Thanks,
-David.

Source record: 225857

Got one Jim:
>>>Are there any problems with the 725?

None that I know of at all. Real basic rig - the lack of an RF gain control gets some folks. Operated this rig as part of 5a group for 24 hrs straight at field day. Rig showed no signs of strain at all. Get good audio reports all of the time.

I got an unbeatable deal on this rig and accessories when I bought it a few moonths ago (RIG, ICOM HeadPhones, CW Filter, FM Board, Tone Board, COmputer Interface, mobile mount - $650). For the same money I might consider the kenwood 140S - has a few more features.

The 725 is a great rig - but very basic. And the specs do fall a bit short of the other ICOM rigs.

>>>What about the power supply and ant. tuner:
I use the Diawa PS with my rig. It costs the same as the Astron but puts our 30 amps steady I think and has extra jacks like a cig lighter plug - real handy.

Got the MFJ tuner as well - works great with a G5RV.

>>>Also, what all band, 160m(?), 80m-10m vertical antenna, would you recommend? What's a typical price? Which company has the lowest ant. price?

I would consider:
For 40-10 - Cushcraft R7 - can be mounted anywhere NO RADIALS needed. great performance if up high. About $340. MY FIRST CHOICE - GOT ONE

GAP - in Miami Fla has several models for 160-10. Said to be good performers ground or roof mounted. $200-$200

Buttternut - Do not know much about these guys.

Plain jane 80-10 vertical - ground mounted made by several companies. REQUIRES ground radials - At least 8 for decent performance) $100-150 range made by several companies.

Dave,
From past expierence w/FRG9600, as far as I know there is no mod for
scan rate UNFORTUNATELY! I had one and tried in vain to get the bugger
to scan faster. In the process, I nearly mis-aligned the receiver...be
careful if you have a golden screwdriver. On the HF mod, I wish I
found this out 6 months ago...I sold the FRG9600!
Good Luck...

: Ham transmitters can be very useful in molecular physics experiments. For
: example, working on a cold-atom trapping experiment,

: ... I was able to get a 2000V
: 4MHz electric field on a wire, by using an old tube kw linear. I used a
: 50-to-12 ohm balun, plus a homemade 12-ohm non-inductive resistor and
: air-tuning coil, and was able to get the electric field across a 100pF load,
: with under 250W from the amplifier.

If it's high RF voltage you want, why not just rip out the output tuning pi-network and couple directly into the plate? (Through the coupling capacitor of course.) Add a large-value, high-power resistor in parallel to soak up the watts. You may want to leave in the pi-network tuning capacitor to tune the plate choke inductance to 1.0 MHz. That arrangement would give you a low-Q, high-voltage output, which is what you are looking for.

If you need to drive a capacitive load, you can add a suitable shunt inductor to get proper tuning.

I recommend that you contact Henry Radio: 1-310-820-1234
in L.A. They make custom amps available for plasma and RF
sputtering as well as for communications. Their stuff is
very rugged, and they may be able to fit up some modular
coils to meet your frequency and/or Q needs. I have owned
several amplifiers made by Henry Radio and was always quite
satisfied with their performance.

<Shameless plug for Amateur Radio!>

Given your technical background, you would be a valuable
asset to Amateur Radio...look into the new no-code Tech
License, it's easy and a fast way to get started. 73!

**********Art Walker at Stanford asked for help in setting up communications for Race Across America.**********

Two suggestions on your bicycle communication problem:

1 - Try GMRS - The General Mobile Radio Service. This is a "Citizen's Band" with a difference. It uses FM at frequencies similar to HAM UHF. A license is required, but you only have to fill out a form and pay a fee. Repeaters similar to those used by hams are available to increase range (although they may not be available in all parts of the country). Radio Shack carries GMRS handy-talkies as do many commercial radio vendors. The band is civilized and business-like.

2 - Cellular telephone - This may be more expensive, but has the advantages of:
a) being able to phone home (ET?)
b) direct access to emergency services.

Good Luck!!

2641. DUAL BAND - WHY?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-06 22:51:46 UTC
From: kn4aq.gary@mms.raleigh.nc.us
Message-ID: <9407062251.0W49E00@mms.raleigh.nc.us>
Source record: 225872

Ne> I've become very curious about why people purchase dual-band rigs.

Hi, Rich. I bought a dual-band HT (Icom W2A) so I could use both 2 meters and 440 MHz, and only carry one small radio.

Ne> From my point of view, a HT should be an efficient communications
Ne> device.

Indeed -- and one radio = two bands is VERY efficient.

>And yet, people insist on buying these wideband-RX
Ne> gadgets that get swamped with intermod if you look at them cross-eyed,

It certainly is worse than my dual-band mobile/base (Icom 2410). But when used with the rubber duck (usually the extended length duck), no problem most places. When used mobile on the car antenna, there are some bad spots around town that bother the HT a lot more than the mobile. I'm willing to trade that for the broadband coverage. I don't do a lot of "scanning" type listening, but I do some. Power failure at work? I tune in the power company's repeater and know what happened, where, and when its coming back on... etc...etc.

Ne> have receivers that are noticably less sensitive than even cheap
Ne> single-banders,

What gives you that idea? The W2A hears signals below .2 uV. There is no compromise.

Ne > have low output power and battery capacity,

The W2A is only 1.5 watts with the 7 volt battery, but 5 watts with 12 volts. My W21A puts out over 3 watts with the 7 volt battery. They both have power saving features that extend life considerably. I've used them litteraly all day at public service events, and ended the day using just one battery. Do you have some kind of grudge?

Ne> become unusable if you try to attach an external antenna to them.

Not Unusable... but there is some trouble.

Ne> Or is the ability to communicate no longer a priority with
Ne> amateur radio operators? :-)

Glad you put in the :-), I thought you might be looking for a flame...

Back in the '70s, I carried three (big) HTs on my belt -- for 2, 220 and 440. That was in Chicago. There's not much 220 here in Raleigh, so I can get away with one dual-bander... until the 220 repeater gets on the air. And then there's the six meter repeater, and the 10 meter

repeater, and.....

From: kb7uv@panix.com
Message-ID: <2vfhcc$ro@panix2.panix.com>
Source record: 225867

My FT-5200's fallen, and it can't get up!

First it was acting kinda weird, so I figured the CPU was a bit confused
and a hardware reset was in order. Unfortunately, after the reset I
can't get the radio to tune. All other functions seem to be working, but
I can't change the frequency!

Is there something I missed in the manual that discusses this, or is it a
new one?

Anyone have any ideas? I'd rather not have to send it in if all it needs
is somekind of "hold in the <key> button when powering on the unit" to
fix the problem.

Thanks and 73,

-Andy-

2643. Is SIGNAL ONE still in business anywhere????

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-07 00:43:23 UTC
From: a-rickf@ac.Tandem.com
Message-ID: <CsJooB.59o@ac.tandem.com>
Source record: 225868

I've a Signal One Transceiver in the shack at home, and would like to connect it to a computer for control. I've the original manuals and such for the unit, but not the software to control it. To tweak your memory, it's a commercial transceiver that will transmit anywhere from (at least) 1.0 mhz to 30mhz. I don't remember the model number but can look it up when I get back home this evening. It is a solid state rig that (if memory serves me right) has about 200 watts max output, multicolored digital display, and can be tuned from either a rotary knob or with "thumbwheels". It transmits SSB, FSK and so on, but will not transmit AM, though it does receive AM. It can tune from 200Khz to 30Mhz in receive mode.

Anyone out there familiar with the company or where it went?

I've got the interface spec for pinouts, but don't (think I) have any information on the command set. I can write my own control program if I can just find information on the commands. Finding the actual software offered by the company would be even better. I'd appreciate any information you might have.....

Thanks

2644. Looking for a VHF rig.....

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-07 00:56:00 UTC
From: a-rickf@ac.Tandem.com
Message-ID: <CsJp9D.5EM@ac.tandem.com>
Source record: 225869

I'm looking for the "right" vhf rig (my first on VHF). As I'm just beginning to look, I'm not all that sure just what I need.

For starters, I'm in San Jose, CA, and think I need a 2m/440 dual band, probably (first) a handheld. I believe I'll need PL capability (at least transmit), and would like to be able to handle occasional excursions into packet or automobile use until I can afford a second (or third?) rig. Boy, this could sure get expensive. Maybe I just need to upgrade my ticket and fire up the HF rig on phone....Nah, do both.....when I get the time..

I've heard the Yaesu (470?, 530?) might be the right choice (or at least one of the right choices...).

Additional requirement: when running on battery pack, the ability to connect an external power source (charger or dc power cord for in an automobile) without needing to remove the battery pack.

If/when I can afford it, what might be a good automobile (pickup) mount unit. Probably want one with a single output connector to avoid needing a multiplexor (or have the pickup start sprouting yet more antennas... and could it do double duty as a packet station in the shack?

As I'm in a metropolitan area, am I better off with more power on a HT, and what's the best way to get it? Larger battery pack (higher voltage or current capability) or dc power cord to the auto battery?

Just full of questions, I guess.....Email or reply with your favorite rig and help me decide what "toy" (my xyl's term) I should buy next.

Thanks

Rick Frazier KD6QZD San Jose, CA

2645. CPU/PROM Chips & Info Needed!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-07 01:30:54 UTC
From: steven@sgb.oau.org
Message-ID: <CsJqvJ.J42@sgb.oau.org>
Source record: 225877
Cross-posted to: alt.2600,rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.equipment

I am looking for sources of the CPU and PROM chips for cellular-capable scanners. If anyone knows how they were changed to be no longer easily modifiable -- I'd appreciate some feedback.

It is my opinion that all that changed was the chip(s) used. Since the non-blocked chips are used in the international versions I would imagine they are STILL MANUFACTURED.

Since the dumb, stupid twits in the government made this law, it leaves only two choices:

[1] Order from overseas and pay the customs duty.
[2] Order in the chips as spare parts and repair our scanners!

While I am surprised no-one has done it yet, it is NOT against the law to package up the chips, parts, instructions and sell them to radio hobbiests to repair their own scanners to cover the FULL 800 mhz band. I mean Radio Shack could bag these as kits of parts and resell them!

Why is this not occuring? Are we lacking interested hobbiests?

The law does NOT prohibit ANY of the following:

[1] Manufacturers selling the individual chips and instructions to restore the omitted frequency ranges. They could say the ranges were omitted in order to obtain FCC certification.

[2] Raw materials such as chips, semiconductors, and even subassemblies (which are NOT restricted by the FCC or any other government agency). This is why the Opto-456 can permit a non-modifiable Pro 2006 scanner to receive cellular.

[3] Manufacture of kits (see above) for users to assemble. Keep in mind that users do NOT need FCC certification and are not considered manufacturers if they are not made for purpose of resale.

[4] Servicing a scanner and or making modifications to a prior owned scanner under a contract for certain work to be performed such as adding cellular via replacement of chips is also NOT illegal since the scanner was previously manufactured or imported as an approved product. Admittedly, the changes would cause it to lose that certification, meaning you could not legally resell the modified version, but the law does NOT prevent you from owning or using a none certified scanner. The fact that it becomes no longer certified thus

becomes insignificant now.

I am posting this message to alt.radio.scanner, rec.radio.scanner, and also alt.2600 because the folks in alt.2600 seem to always have the information first, for example with cantor and seigel, they had the scoop on name, address, phone numbers, network data, right down to the fact they had a nice pool to be nicely attacked with all sorts of "vandalism" (since they had already electronically vandalised the network with advertising, it's an appropriate recourse). Another example, cellular phones, this is where you can find out how to alter them, change them, reprogram them, and yes, use them as cellular RECEIVERS (anyone listening out in bonehead government-land??? We need to BAN CELLULAR PHONES!!!)

Anyhow, this is an open solicitation for ALL available information on names, addresses, phone numbers, of where spare parts for the various popular scanners can be obtained, bought, etc, and if anyone knows what the changes are in the newer not easily altered units? I suspect just a change in the chip used.

I figure if I can't extract the info from the rec.radio.scanner section, perhaps one of the electronic hackers in the alt.2600 forum will have done this already.

Back when it was add the resistor, move the diode, remove the diode, change the diode, the modifications were out within DAYS of the units being available.

Now all the geniuses who provided this information seem to have simply given up or quit. I really do not get it. I'd imagine it would be a bigger challenge now than before. I'd also imagine the radio amateurs who are known for their homemade equipment and mods would not have wasted any time in determining what changes would be needed.

This does not appear to have happened yet. I do not understand why.

I do not buy the brainwashing that "it can not be done". Just because the federal government bought the story from the manufacturers does not make it so. A company COULD go into business restoring the cellular by replacing the chips. The law would not prevent that from being done. The scanners met the letter of the law by not being easily modifiable. So, maybe they are hard to modify. I still do not see why everyone has given up.

I'll admit its easier to dump the U.S. sales of scanners and buy from overseas, but I do not see why no-one has investigated what it takes to fix these broken scanners that are missing two slices in the 800 mhz band.

It is not against the law to sell the parts or modify a previously owned unit (you are not manufacturing it, as it was already manufactured, you are not importing it either, you are professionally modifying it for cellular as a contract service being performed).

Anyone have any answers? I would appreciate any information, addresses, names, phone numbers, tips, prices, part numbers for what needs to be replaced in these broken scanners (such as the Pro-43 As!) Also I am still working on the directory of international dealers. If you wish to pass

along information on them as well (name, address, phone numbers, fax and voice if possible, charge cards accepted), I'd appreciate it.

Please e-mail this information to the account:

scaninfo@sgb.oau.org

I have had it created for the purpose of data collection.

I will share the results with everyone when I have them compiled. Please do not think because "someone else" will pass the info along, you do not have to. I do not mind duplicate information... I'd appreciate everyone's help. If we work together, we can have even the latest FCC approved non-modifiable scanners receiving cellular in every hobbiest's hand!

All constructive comments would be appreciated.

Thank you for your assistance,

Steven

2648. SALE: FT-757 GXII and FT-726R

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-07 04:33:35 UTC
From: alysa@netcom.com
Message-ID: <alysaCsJzC2.Kq@netcom.com>
Source record: 225873

Hello....

I'm not too sure if this is the appropriate place to post this ad; but if not, please accept my sincere apology and simply delete it.

I have two ham radios originally purchased from Henry Radio (in Los Angeles) several years ago. Since then, I have come to the realization that I simply don't have time in my personal life to pursue amateur radio. Consequently, I would like to sell these radios to someone can use them.

First, is my Yaesu FT-757 GXII w/matching FT-757HD power supply. It is almost six years old BUT is still in the original box, including all technical manuals and purchase receipts. It has NEVER seen any use except to be unbox-ed every few months and powered-up for a few hours. For those who have seen one, they're really compact and quite suitable for mobile or emergency use.

Second, is also a Yaesu. It is my FT-726R. It too, is still in it's original box with all technical manuals and purchase receipts. However, unlike the 757, it has seen some use. I used it for Red Cross communications (last January) in support of the Los Angeles Earthquake relief effort. It has the 144 MH module along with the tone module.

(The last is my personal FT-727, but I'm simply too much in love with it, fitting neatly into my glove compartment or briefcase).

Should you have any interest in either of these two radios, please E-mail. Please understand - I'm not trying to get rich from selling these radios, but on the other hand, I not Ms. Santa Claus either (besides it July 4th!) - let's agree on a price that makes us both 'winners'.

The original price for the 757 was about $825 and an additional $200 for the power supply and about $1,000 for the 726. But any reasonable offer will be very seriously considered.....

2649. Yaesu FT-707 Power Output...

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-07 06:03:18 UTC
From: ham@wam.umd.edu
Message-ID: <2vg5r6$alb@cville-srv.wam.umd.edu>
Source record: 225875

I have been playing with a Yaesu FT-707 complete system, with the CW filter installed. Everything works fine, but:

When you set a power output level with the CW wide (standard IF filter) setting, you get a certain power output. Change to narrow, and you get roughly half the power you were getting before!

It can be adjusted, but why? I've traced it so far as to knowing that the xmit signal is the same until the point at which the IF filter is reached, and coming out of the filter section the signals differ. Granted, a narrower BW filter could conceivably clip some of the signal, but it's a 500 Hz filter, so i wouldn't expect any of this to be happening.

Just an annoyance, the radio works fine otherwise. Anyonw have similar experiences or is able to tell me why? A mere readjustment of the PO on the front panel sets the power level again, but why should power be twice on CW wide than it is on CW narrow? It's the filter circuit, but WHY? Why even use the IF filters?

I picked up an HP 8555A 0.01-40GHz Spectrum Analyzer plug in at a hamfest in "as is" condition. It turns out that the input mixer is most likely damaged. The thing still works, but signals are about 30dB or so down. The mixer is a module inside the plug-in. Its part number is 5086-7177. It's a smallish rectangular metal box, about the size of a match box. It has several coaxial connectors (input, ext. mixer, IF out, LO in, LO out, ext. IF) and several pin connectors (ext. bias, diode bias, emitter bias, +10 Volts). It is a Hewlett Packard part.

If anyone knows of a source for these (working ones!!) or an updated replacement part, please drop me a line.

Thanks for your time,
dale

Ta> I would like your opinions, comments, on the ICOM-725 HF transceiver

I have a ICOM-725 rig, which has worked well the year I have had it. I bought this simple tranceiver for my first rig. Althought it has no special features, it has been enough for me to make a couple of hundreds of cw contacts 3.5MHz-28MHz at 30 W. The keyer I'm using is an oldtime style one.

I have noticed that the S-meter doesn't show any readings sometimes especially on higher bands, maybe due to the low signal level from my Butternut vertical.

Subject: Anyone experienced with Cushcraft R7?
Newsgroups: rec.radio.amateur.antenna
Organization: NETCOM On-line Communication Services (408 261-4700 guest)
Summary:
Keywords:

I am in a restricted antenna house, and I am looking for suggestions on a antenna for HF. In previous lives, I have tried to use several different vertical antennas including Butternut and Hygain, only to be very disapointed.

The Cushcraft R7 has caught my eye, and I would appreciate hearing from anyone with experience with it.

I am also curious about the GAP antenna, and would appreciate any other suggestions for good performing HF antennas in a limited space and restricted envirnoment.

Thanks.

>Shack could bag these as kits of parts and resell them!

You won't see Radio Shack do anything that even comes close to what you want.
Remeber, RS is the company that pulled all of its double conversion scanners
off the market in New Jersey because word got out that cellular images could
be heard on these scanners. They also supported the ECPA if I remember
correctly.

If you order a new micro from RS they will send you the one will cellualr
blocked. You will have to order your scanners and parts from some other
country like Canada.

While I agree with you, I think the issue will die down as more digital
cellular is used. This will put an end to cell monitoring for most people
(although with the advent of DSP/sound cards for the computer, new
possibilities may open up).

IMO, cellular monitoring is one of the most boring aspects of scanning anyway
(except maybe at 3am).

Hello everyone,

I have recently come across adverts for the US-made "PARTRIOT" hf rig.
It looks quite reasonable to me, and I wonder if someone has info or
experince regarding this rig.

What interests me particularly is reliability, signal quality and RX-
intercept. If I receive several interesting answers via e-mail
I will summerize and post them.

Cheers, Moritz, DL5UH

Hi,

I dunno but sometime back I posted some mods, computer interface,
control software, cheapo HF kludge etc. etc. for the FRG-9600 and I believe, to
this date, this is the ONLY FRG-9600 mod I have come across in my search.
Someone should have one with them somewhere. Its called FRGSC127.ZIP which is
the latest version.

2656. TS450 to PK232 Hookup

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-07 11:39:20 UTC
From: nunas@solomon.technet.sg
Message-ID: <2vgph8$irt@raffles.technet.sg>
Source record: 225879

Does anyone out there have a PK232 hooked to a TS450?

I cannot hook the AFSK output from the pk232 to the Kenwood accy jack and get it to work.

What happens is heavy distortion when I try to use the mic.

AEA is aware of the problem and say to use FSK. Fine, but what if I would rather be able to use AFSK (eg, yu can easily change the shift on it and you cannot on FSK).

The problem seems like some sort of ground loop fault.

Any ideas ???

Thanks from the land of endless summer . . .

Maurice Nunas

2660. Ten-Tec 1208 transverter - update

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-07 14:38:44 UTC
From: dgf@netcom.com
Message-ID: <dgfCsKrCK.LHp@netcom.com>
Source record: 225881

I called Ten-Tec yesterday and found that 1208's are still "3 weeks away".
The person answering the phone indicated he was in the process of building
a test unit.

Seeing as I will be using it with my Argonaut 509, and seeing as the 6M
E season will probably be over by the time I get the unit, I may just
modify it to be a 160M transverter for the argonaut!

To the person making the prior post on the subject (I didn't post the
follow properly), it is in-line switched (nothing but 12V and coax
to your rig's antenna required), however, it is a *20M* IF and takes
a max of 5W from the driving rig (these are based on published specs).

Message-ID: <2vh42i$4hf@blue.weeg.uiowa.edu>
Source record: 225882

I built a Ramsey FX 146 2m transceiver which I use mainly on packet. It has worked well in the past.

I moved and after a year hooked the packet up again. Lots of trouble getting anything, with sometimes a connection and usually not.

I put an SWR meter on the radio and it shows 2watts out versus a spec 4 - 5 watts called for on this radio.

I've tried with poor results to tweak power before. Anyone with suggestions on either tuning or possible component problems? I'm getting the mood to get back into ham and would appreciate your assistance.

In <CsJqvJ.J42@sgb.oau.org> steven@sgb.oau.org (Steven Bradley) states:

|I am looking for sources of the CPU and PROM chips for cellular-capable
|scanners. If anyone knows how they were changed to be no longer easily
|modifiable -- I'd appreciate some feedback.

|It is my opinion that all that changed was the chip(s) used. Since the
|non-blocked chips are used in the international versions I would imagine
|they are STILL MANUFACTURED.

|Since the dumb, stupid twits in the government made this law, it leaves
|only two choices:

| [1] Order from overseas and pay the customs duty.

However, this is probably restricted for certain scanners that default
their scan increment to 30Khz. European cellular apparently scans in
25Khz steps, so you are probably restricted to North American countries
(What do South American countries use? North American cellular standards?)
Are there other areas of the world that use 30Khz increments?

| [2] Order in the chips as spare parts and repair our scanners!

Can the newly-imported AOR-1000s be reprogrammed via jumpers and
keyboard strokes as printed in Bornestein's "Guide to the AR-1000?"

You know, in a time when business is ruled solely by the almighty dollar, it's good to see a company run by ENGINEERS, and not businessmen. Typical industry has a marketing division which says,

"The Engineers say they can have it by June. We want it by May, June at the latest. No negotiation."

Of course, the Engineering division has problems (because nothing ever gets done as quickly as it's "supposed" to, according to the businesspeople running the company) which aren't really problems at all, and the public becomes a bunch of paying beta-testers.

We are to keep patronizing Ten Tec. This is a GOOD outfit, and a good one to deal with. No excuses - I'd rather they got it right and it took an extra six months to produce. That's how it should be done.

Greetings,

I am looking for the schematic for Kenwood's IF-10B (not -C, -D,
or other), and have called Kenwood, their parts supplier, and virtually
all the relevant advertisers in QST without any luck. It is a tiny
board that fits in the "control board (??) / processor" compartment of
a TS-940 and is used for external (computer) control of the rig.

IF-10B is a discontinued accessory, and I'm thinking of kludging one
together.

If anyone knows a source, or is willing to mail me a xerox copy, please
drop me some email.

I will gladly reimburse your copying/handling/shipping costs...

Regards;

I got an 8555 at a hamfest and it was intermittent: either OK or
20 or 30 dB. down. Turned out the *attenuator* was intermittent,
not the mixer. I suspect you also have a bad attenuator. Try
bypassing the attenuator before you replace the mixer.

I was rereading an old QST article about using power MOSFETS as key line shifters. The idea is that most rigs take the key line (normally at some voltage) and bring it to ground in order to generate dits and dahs. There were four combinations:

1) positive to positive
2) positive to negative
3) negative to negative
4) negative to positive.

Numbers 1 and 3 make sense to me. If the rig draws more current than the keyer can deliver, something is required to allow the additional current to be drawn.

Why would 2 and 4 be necessary? The keyer is a different unit from the rig so why couldn't the wires be switched around so that the polarity is the exact opposite?

As a side issue, I believe most rigs have positive key lines. How common are rigs with negative key lines?

Interesting. My Alinco DJ580T - aka the intermod special - is the poor performer in our house. Even with the stock duck, standing inside my living room the Alinco gets wiped out on some frequencies, bleeping and booping and desensing like crazy. My stepson's TH28, on the other hand, seems to be a reasonable performer with no more than the expected susceptiblity of most of today's DC-light mini-hts. Sure you can't hook a gain antenna up to it and not expect trouble, but with any reasonable duck it does just fine.

I rather expect we're seeing some variablility in manufacturing here.

> Hi, Rich. I bought a dual-band HT (Icom W2A) so I could use both 2
> meters and 440 MHz, and only carry one small radio.
>
> Ne> From my point of view, a HT should be an efficient communications
> Ne> device.
>
> Indeed -- and one radio = two bands is VERY efficient.

Very excellent reasons. There is one additional feature of dual bands
that I found very useful is cross band repeat. Many times my friends
and I have used my car's FT-5100 as link to the local repeater while
we are in some ditch to hit the repeater directely during bicycling
coverage.

Make sure you turn on the engine every so often during the whole
period otherwise you are the one who will be calling for a jump start.
Happned to me couple of times....it is more embarasing then annoyng
in front of your family :-).

Todd Jonz (tcj@infoseek.com) wrote:

: > Can anyone comment on how bad intermod is on this unit, compared to
: > others like it?

: In the same vehicle with the same antenna, my old unmodified TM-741 didn't
: have anywhere near this much trouble, and only crackled occasionally when in
: the vicinity of the known hot spots I mentioned above. (I mention that the
: rig was unmodified because I have heard complaints about some of the common
: TM-741 mods effecting sensitivity.)

While I can't compare the 733 to a 741, I can say that mine does a
bit better than a 732. On the other hand, I've never really experienced
the severe problems reported by others with the 732. The 732 did a
reasonable job, and the 733 seems a bit better. Driving through my
worst known intermod spots nets me an occasional crackle but nothing
worse. I've never felt a need to turn on the AIP yet.

: It sure would have been nice if Kenwood had seen fit to include a form-fitting
: storage box for the head to live in when it's not attached to the rig, as is a
: fairly common practive for audio toys with removable heads. This particular
: head has lots of little bulgy bits that rotate very easily due to incidental
: contact with other goodies in, say, a carryting bag; it's important to
: visually check the position of the volume and squelch controls before
: reattaching the head, lest you blow out either your speakers or your ears.

Agreed in spades! The detachable face is easy to use and wonderful, but
it really does cry out for a nice storage box.

: > Are there any glaring problems or overlooked features on this
: > radio?

: Since I had not voluntarily elected to activate a particular function,
: figuring our how to deavtivate it often resulted in an exciting romp through
: the not-particularly-well-organized documentation for the rig. On a couple of
: occasions I had to resort to a hard reset to restore full operation, which of
: course blew away everything I had tediously entered into the channelized
: memories. Grrrr. Oh well, I guess that's the price of progress, right?

I also agree about the non-intuitive interface, and the likelyhood of
hitting the wrong buttons taking you to a strange mode. However...
Kenwood was smart enough with this radio to realize how likely this
possibility was. Because of this, they have provided several (4 if
memory serves) different reset levels that range from resetting
everything, to a lot, to a little. It is very easy to reset the radio and
leave all of your memories alone. Check the "reset" section of the
manual. I've never been able to put the radio into a mode bad enough

that one of these resets didn't work for me. Good job on this one!

Another nice feature of the radio for those who actually use some of the whizzy whizzies of new VHF/UHF gear are 6 programmable "state" memories that allow you to store and recall the state of virtually every feature in the radio. It makes it easy to create radio "modes" for different uses, or users. Again, nice!

Some other comments, since I'm wound up :-)

Kenwood touts their nice "Automatic Simplex Checker" as a slick and easy way to work a repeater and automagically tell if you're within simplex range of the station you're working. As a charter member of the Society to Increase the use of Simplex, I thought... neat! Useless, I found. The receiver changes frequency to the repeater input every *3 SECONDS* to check the other station's signal level and flashes a symbol on the display if simplex is reasonable. The check happens too often, takes too long, and you really can't see the flash when mobile. All you get are repeater conversations that are continually interupted.

Kenwood also did a nice job on putting the multifunction keys' current function onto the main display with backlighting. Sounds great for mobile use, but it's actual usefullness is somewhat compromised by the small size, and the poor alignment of the displays in some of the sub-function modes. And they still haven't wised up and backlit the @#%*@#^$ DTMF mike!

All-in-all, I like the radio, but Kenwood still has a ways to go before I'll think they've got it right.

: Interesting. The 733 was obviously introduced to recover from the
: receiver problems that the 732 has. There ads emphasize the "intermod"
: performance of the 733. Do you know what the AIP circuit really does?
: I assume that its more sophisticated that just an attenuator but I don'
: know. Does the receive sensitivity change noticeably when its activated?

Well as I posted earlier, I've never really had problems with my 732 so
I might be a poor judge, but I'll reiterate that I've been quite pleased
with the characteristics of mine.

As far as AIP is concerned, it's my understanding that all AIP really
does is bypass the receiver's RF amp. The net result, according to ARRL
reviews of Kenwood's HF rigs with AIP, is essentially indistinguishable
from inserting an attenuator. And yes, the sensitivity does change
noticeably.

Conway Yee (yee@mipg.upenn.edu) wrote:
: I was rereading an old QST article about using power MOSFETS as key
: line shifters. ...

There are basically two combinations in common use. Older tube-type transmitters used grid-block keying: A negative voltage biases OFF the final amplifier tube. When you close the key contacts, the negative voltage is shorted to ground, allowing the amplifier tube to conduct. Open-circuit key jack voltage typically runs minus 50 to minus 150 volts or so. Short-circuit current is a few milliamps.

Solid-state radios use a positive key voltage, again shorted to ground to enable the transmitter. Open-circuit voltage is typically around +5V to +12V. Short-circuit current is again a few milliamps.

A few of the really old tube-type transmitters used cathode keying. In that case, the open-circuit voltage can run +50 to +300V or more with closed-circuit current being equal to the final amplifier current, perhaps as much as an Amp. Make sure you have a well-insulated key if you use one of these monsters!

John R. Myers (jmyers@netcom.com) wrote:
: : Tokyo? Bargains? Surely you're joking Mr. Adams. I was in Tokyo last Sept
: : (when the dollar was hanging at about 102 yen) and found nothing that
: : could not be had for a good bit less in New York.

: Just a reminder that when you do your price comparisons you can subtract
: the domestic excise tax. At the larger shops you just show your passport
: and they will discount your purchase on the spot.

Good point - the shohizei or "consumption" (sales) tax is 3%. However,
if you bitch and moan enough, many shops won't bother hassling with you
about it.

In Akihabara (Tokyo) - I suggest the following stores:
T-Zone (they do carry some "export" models)
Ham Geppan
Rocket

Also - be forewarned that Akihabara is famous for being a "Mecca" of sorts
for people seeking virtually any kind of electronic goodies. It is NOT
known as being the place to go for the best prices. There are other
places to go outside of Tokyo proper (if you have the time) where prices
are a bit lower. Some of the larger shops in Akihabara that sell
ham gear also have stores in other parts of the country and in the
the suburbs of metropolitan Tokyo.

Be aware that it is now extremely difficult to buy an "export" model
of VHF gear. The JAs are limited to 144-146MHz on 2M; a few years ago
a "J" mark was added to most HTs to indicate that they could NOT be
reprogrammed for 144-148MHz.

A few other comments about buying Ham gear in Japan:

1) HF rigs come in several power "flavors" to match license classes in Japan.
If you buy an HF rig there, make sure you get the power rating you want
(10, 25, 50, 100 watts, etc.).
Make sure that the HF rig has the ability to transmit on all bands
available in your home country (e.g. JAs get only 7000-7100 KHz).

2) No 220MHz rigs in Japan (those freqs are used for broadcast television).

3) 70cm "domestic" rigs operate only 430-440MHz (not 440-450 like in USA).
ALL 70 cm repeaters in Japan are "required" to use the mandatory
88Hz sub-audible access tone.

4) As mentioned above, 2M JA equipment is good only for 144-146MHz.
Since there are no repeaters authorized on 2M in Japan, be careful
that any rig you buy is useable in your home country.

Cheers de Sandy

|> Peter/KA5COI
|> richesop@delphi.com

Low volume is a real problem for bicycle operation if you ride on roads in hilly country or with traffic. It's less of a problem when mountain biking. Above 25mph or so, wind noise is substantial, making it difficult to hear the radio. Likewise, traffic seems much louder when you're trying to hear a voice on the radio than when you're just grinding along from here to there.

I've tried the little in-the-ear earphones, and they work ok, but I don't really like riding with one in my ear for long periods. I've been thinking about mounting a speaker (or two) on my helmet so that it's close to my ear but not touching it. So far I haven't come up with a really satisfactory arrangement. One concern is crashworthiness. I don't want a speaker permanently implanted in the side of my head, even though that might solve this particular problem.

Ok, I finally bought one of these HTs.

The manual says something on the order that if I have the HT hooked to the power sources and I transmit I could damage the radio, battery, and other stuff. THe official warning.

CAUTION: Operation with an external DC power source simultaneously charges batteries inside the battery case or the battery pack. THis may cause battery leakage and damage the tranceiver or cause battery overcharging and shorten the life of the battery pack, respectively.

Whats the deal? Over caution? Any explanations appreciated.

Help!

I recently purchased a used Tempo (Henry) 2002 2 meter kilowatt amplifier.
(Uses a pair of 8874 tubes in push-pull)

The amp was custom built by Henry to operate on 194 MHz. It was used in an
MRI lab. I'd like to move the amp back down to 144 MHz.

I have the only technical manaul available, which covers the 2002, 2006,
and 6N2. It has a schematic diagram of the amp, but does not provide the
dimensions of the tank coil, (a "U" shaped section of 3/4" tubing)
or any picture of the input circuitry.

Does anyone out there have a Tempo 2002, or have experience
servicing one?

Thanks;

2694. Wal-Mart 900MHz ATV transmitter?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-08 03:15:26 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Jul7201526@susie.vigra.com>
Source record: 225814

Wal-Mart has an interesting gizmo called a "Video Wireless VCR Multiplier" for $29.95. It's similar to the Gemini Rabbit TV transmitter/receiver pairs, but this one is still in production and stocked.

I bought one to experiment with, and it seems to have some promise for ATV work. The transmitter has two output frequencies, each with a tweak pot inside next to the selector switch. It seems to be able to put out a signal anywhere from 905 to 926 MHz with some stability. I have no idea what the (low) output power is, though, and the sparse docs don't say.

There is a new ATV repeater here on Mt. Palomar (San Diego) with a 919.25 MHz input frequency, which is well within range for this transmitter. I'm looking at a small amplifier advertised by Down East Microwave. This "DEM 3310PA" 902-928MHz 10W amplifier seems impressive for $150 (less for kits). It only needs 10mW of input drive, so I would guess that the Wal-Mart box can make it happy.

Has anyone tried a setup like this? I'm looking for any tips on where to install an antenna output jack, since the unit has only a screw-in mini telescopic now. My inclination is to just install a BNC jack connected to ground and the current antenna post. Will I have any serious problems with impedence mismatch?

This certainly seems like a cheaper way to go than commercial ham ATV transmitters. Am I missing something?

Thanks!

2695. Wal-Mart 900MHz ATV transmitter?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-08 05:00:03 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Jul7220003@susie.vigra.com>
Source record: 225815
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Wal-Mart has an interesting gizmo called a "Video Wireless VCR Multiplier" for $29.95. It's similar to the Gemini Rabbit TV transmitter/receiver pairs, but this one is still in production and stocked.

I bought one to experiment with, and it seems to have some promise for ATV work. The transmitter has two output frequencies, each with a tweak pot inside next to the selector switch. It seems to be able to put out a signal anywhere from 905 to 926 MHz with some stability. I have no idea what the (low) output power is, though, and the sparse docs don't say.

There is a new ATV repeater here on Mt. Palomar (San Diego) with a 919.25 MHz input frequency, which is well within range for this transmitter. I'm looking at a small amplifier advertised by Down East Microwave. This "DEM 3310PA" 902-928MHz 10W amplifier seems impressive for $150 (less for kits). It only needs 10mW of input drive, so I would guess that the Wal-Mart box can make it happy.

Has anyone tried a setup like this? I'm looking for any tips on where to install an antenna output jack, since the unit has only a screw-in mini telescopic now. My inclination is to just install a BNC jack connected to ground and the current antenna post. Will I have any serious problems with impedence mismatch?

This certainly seems like a cheaper way to go than commercial ham ATV transmitters. Am I missing something?

Thanks!
-Steve

On my TH-78E i just had to push and hold PTT and VFO, then POWER ON.
I don't know if this works on the 'A' version. Please let me know if
you try.

Can you point me towards any articles on building a 7360 product detector,
etc.? Or did you just do it from scratch using a tube manual? I have
a lot of old QST'a and ARRL Amateur Radio Handbooks that I can research,
but if you happen to know where to look....

Tom

I tried sending E-Mail to you but both times it bounced back as being "Undeliverable". Not sure what the problem is, but I am very interrested in the PC board you have and need to talk more to you about it.

Please send me your E-Mail address and I'll try it again. This time put your address in the text of the message in case for some reason it's not the same I see when I use "Reply".

Tnx

George

HELP! I'm looking for the service manuals for the Motorola Motrac Model U43HHT1100D. It's an older tube-type VHF unit, separate transmit and receive sections, rack mount. Has been "modified" (i.e. re-tuned, etc.) to operate on 2m.

Other than a blown speaker, it seems to be in fairly good working order (and I've already remedied the speaker).

Advise on conditions for obtaining the manual. Thanks!

Mark N9WYS

Tom, The marine band covers 156.25 to 157.425 on the transmit side and from
156.25 to 162.44 on the recieve side.
A station license is required to operate them in us territorial waters,
outside us waters a third class radiotelephone permit is required.
Your ht is not type accepted for this use and modifying it will break the law.
But, and this is cool, some marine band radios have seperate power amplifier
assemblies and some of these work real well as two meter amplifiers. I
converted one that gave me 60 watts with 100mw input. And it had a very clean
signal.

27 157.350 87 157.375
28 157.400 88 157.425

Shore stations are 4.600 MHz above the ship frequency. In U.S.
waters the shore frequency may be used on Chs 20, 24-28 & 84-87.
Chs 1-5 & 60-64 are shared with other services. Chs 75 & 76 are
reserved as guard bands for ch 16.
Specific assignments include:
06 - Intership Safety 13 - Weather, notices, etc
16 - General Calling 22 - Coast Guard Liaison

On-board Communications:

Ch mobile repeater
1 467.750 457.525
2 467.775 457.550
3 467.800 457.575
4 467.825 457.600

***

No test is required to operate a marine VHF, but a station license is required,
and a Restricted Radiotelephone Operator Permit is required to operate in
non-US waters.

Finally, transmitting equipment for ANY band except Amateur must be type-
accepted, thus you cannot legally modify your HT for marine use.

I picked up three camcorder viewfinders at a surplus electronics store a
few years ago. They run off 12 volts, and are lightweight. I would
suggest you scan the electronic experimenter magazines for these type
places. The ones I got were only about $20 apiece, so you should be
able to find something at a reasonable price.

2708. Re: IC-W21AT Power Question

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-08 20:08:59 UTC
From: guillory@blkbox.com
Message-ID: <2vkbor$6ll@blkbox.blkbox.COM>
Source record: 225829

The answer:

Ken, KE8GW, gave me a few ideas and suggested that I call the ICOM
1-800 number. I did and here is the answer.

THe supplied wall charger puts out a really rough, ripply, 1/2 wave
ac power to the unit. (I knew these things did that but my brain
didn't click.) Anyway, this really works good for charging but
the chips in the units don't work well this way. In addition,
you will probably pull more current that the wall charger can
supply and nuke it.

Someone pointed out that that you could not charge the unit
throught the top jack with a 12 volt source. The ICOM guy
said there was 2 models of the W-21AT units shipped. THe early
model shipped with a battery charger adapter that slid on top
of the battery when it was removed from the unit. THis unit
MUST have the adapter to charge from 12v source.

The second model did NOT ship with the adapter and will charge from
a 12v. source. He did not have a range of serial numbers but
the adapter did seem to be the determining factor.

That was the answer!

>Mike, K0TER

Mike, I did it purely using the data sheets and a little tweaking. (I also have a pair of 7360's used as a phasing type SSB modulator in a somewhat tweaked Heathkit HX-30. THAT one was "strange" in that it was a hybrid of beam-deflection tubes and transistors in cascode to minimize crosstalk between the plates and the deflection plates. It worked pretty well before I retired it.)

I'd research old QSTs in the <mumble> early to mid 70s for some data.

I've don't a lot of Rabbit surgery, haven't seen the Wal-Mart box yet.
The Rabbit put out about 1-3 mW depending on the unit. Mine seemed
to wander a bit, a couple of hundred kc. Seems to me that would take
the signal out of the receivers audio range but the receivers seems
to track okay. You could tell by watching a pic for a while, then
turn the receiver off and back on ... the picture wouldn't be there,
you had to retune.

Tweek pots on the _Radio Shack_ rabbits tuned the LO; another pot
under the can at the antenna controlled output power. Just crank
that one all the way up... (Ain't it great being a ham? :-)

I'm very interested to find out how good the W-M unit is.

>There is a new ATV repeater here on Mt. Palomar (San Diego) with a

>serious problems with impedence mismatch?

I didn't see any impedence matching on either the receivers or the
xmiters other than (perhaps) the transister in the first (or final)
stages. Go inside and cut, break, unsolder that antenna and use
whatever connecter fits ... For the receiver, I use an F connecter

and run a RadioShack _satelite_ video amplifier into it. I had LOS to our repeater when it was on a hilltop 40 miles away and this setup picked it up just fine!

>This certainly seems like a cheaper way to go than commercial ham ATV
>transmitters. Am I missing something?

Maybe you don't like the bulge that you still have in your wallet?

Do watch out for spurs from the transmitter. Around here, the interdigital filters made for cellual-bases go for about ten dollars. (As best I recall,) chopping a quarter inch off the rods moved them up to the ATV band. You'll want to tune the whole thing up into your antenna with a spectrum analyser to make sure you're not putting too much trash into the band.

Reply: Hallicrafters SX-71 Service Data

Ardco Electronics
P.O. Box 95
Berwyn, Ill. 60402
(They handle only Hallicrafters data. Excellent service)

SAMS Photofact Folder # 111 covered the SX-71. It's out of print
but a local radio/TV repair shop might have a copy.
If not call SAMS at 800-428-7267. They will sell you a photocopy
at a reasonable price.

Hi-Manuals
Box L-802
Council Bluffs, Iowa 51502
(They do not give quotes, you must send $2.00 for a catalog. They
cover most ham rigs from 1935 thru 1970.)

Don't expect much in the manual. Most had a diagram, alignment
instructions, and perhaps the ### dial cord stringing instructions.
Good luck. SAMS says this is a 1950 model, I was born in 1951.

: - Rich

I think he's talking about mobile radios, not HTs. Dual banders don't
get swamped with intermod the way HTs do, even with extended receive.

BTW, my vote is for the Kenwood. Contrary to what others say, I've had
very good luck with their service department, and that 733 is a really
great radio, just as the 732A was.

Good luck.

: Any ideas ???

: Thanks from the land of endless summer . . .

: Maurice Nunas

You really should use FSK rather than AFSK. The receiver works much
better if you have the 500 hz filters. The difference between a 200 Hz
and a 170 Hz shift is nonexistent anyway. BTW, my 850 will allow me to
select the FSK shift. DOesn't the 450 have that option (not that it
matters).

>I would be interested in opinions on the Yaesu 990, good, bad, indifferent.
>Is it worth the bucks?

>John Zimmatore
>IBM Atlanta
>zim@vnet.ibm.com

I have an FT-990 and am very pleased with it. I found it to be a great compromise between the slightly under-featured 890 below it and the over-featured 1000 above it. (The difference in price for the configurations I was considering was about 20% for the 890 vs. the 990 and about 50% for the 990 vs. the 1000; the 990 was clearly more than 20% more radio than the 890 but the 1000 was not clearly 1/2 again more radio in my hands.)

Features that I really liked about the 990: 10-key tuning pad, filter options down to 250Hz for CW, the "digital" audio filter (it's not really digital, but it _is_ very good), packet and rtty modes.

The only downsides I know of to the 990 are somewhat less than terrific fidelity for SWL (if you expect to listen to a lot of music from foreign broadcast stations on SW, this is probably not the radio for you) and an imperfect placement of front-panel buttons (the row at the bottom is somewhat obscured by the knobs above them). Also, I really wish they'd added a loop on the back for putting a DSP in between the preamp and power amp stages, like you might do with a stereo system.

I chose my 990 after a _LOT_ of research -- asking other hams for opinions, reading up on the product reviews (get the ARRL Radio Buyer's Sourcebooks, Vol 1 & 2 -- the best $30 you'll ever spend!), calling the vendors (you'll find it instructive to call Yaesu, Icom and Kenwood and ask, "Why should I buy your radio?"), talking with dealers ("What's the most popular rig in the $2000 price range?" "If I buy X today, what will it be worth in trade-in a year from now?"), and sitting in the dealer showroom playing with the knobs.

Before you drop a big chunk of money on a radio, you owe it to yourself to check it out carefully. You're on the right track with this post. Keep it up! My sense is that it's hard to go wrong with the 990, but more important is that you choose the radio YOU like best. Other people's opinions don't matter so much. :-)

2721. mods for Kenwoods TH-28A

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-10 01:24:25 UTC
From: justin@sequent.com
Message-ID: <1994Jul10.012425.23245@sequent.com>
Source record: 225748

I recently purchased Kenwood's TH-28A radio. I had the intentions of it receiving far more freqs. than is does. I can only seem to RX on 136-170Mhz & 400-519Mhz I was really expecting the radio to be able to get freqs. like 45-900Mhz. I know this is not impossible but maybe with this radio. BUT I was curious if ANYONE knows of ANY ways to get freqs. like 45-47Mhz and 880Mhz. If there is a mod sheet anywhere that would help too. I talked to a guy at HRO and he said that there was a way to expand its range v

ia keypad. He said to hit the function key(F) down for one second and the low key. I tried it and I just got the SAME freqs. Maybe it is some other combo.??? BUT I would GREATLY appreciate any and ALL help available.

Regards,
Justin

>
Hi Steve, Timewave told me that their A/D system is a 16-bit sigma/delta
system with a single-pole sigma filter. They wouldn't tell me what
adaptive filtering algorithms they use.

A 16-bit system gives you a lot more headroom so "riding the volume
control" is not as much of a problem. With the approximately 50 dB
dynamic range of an 8-bit system, you have to "ride the volume control"
to keep the 8-bit value at near full scale but not saturated. With the
16-bit system, you can set the input for a full-scale 12-bit value and
not worry if the signals vary between 16-bit and 8-bit full scale values.

A 16-bit sigma/delta system with a three-pole front end would be better
at eliminating quantization noise than the Timewave design.

: require riding the volume control when tunig from loud to quiet signals,
: are these any better?

You are correct in that the W9GR box requires frequent adjustment of the audio gain, especially during roundtables. Almost always there are weak signals alternating with very strong ones in any roundtable. To hear the former, one has to turn up the gain and when the latter comes on, it saturates the DSP.

I built one of the original 'GR kits and found it to be a quantum leap in ham technology, so I put up with its limitations for a while. Then I realized that an audio AGC would overcome this particular problem.

Steve Szabo, N1AYO wrote an article in Feb, 1993 ELECTRONICS NOW describing a simple circuit using a Signetics IC chip that provides exactly the function required. He offered a kit of parts, so I got one and added it to the 'GR box. It works very well and I no longer have to ride the gain control when using the system.

The 'GR box still has limitations: it uses only an 8-bit system so is very limited in dynamic range, and the original box had a very inconvenient means of changing modes. No doubt later boxes represent very significant improvements. But I consider the 'GR box like a Ford Model T. The Model A represented a considerable improvement, but the step up was like nothing compared with the original step from a horse and buggy!

I don't know whether Dave Herschberger is still offering his kits for $125, or not. If he is, it is still the best bargain I know. If anyone wants to find out, you could ask him. He used to have an E-Mail address: dlh@gvgdsd.gvg.tek.com. I don't know if this is still valid.

Steve Szabo can be reached at: C & S Electronics, Box 2142, Norwalk, CT 06852-2142, phone or FAX: (203) 866-3208.

Hi,
The Micor uses a '2135' key which are generic and you should be
able to get one (most likely without cost) from any Motorola service shop.
If you are unable to find one, let me know and I'll mail you one.

Why are you talking PEP when repeaters run on FM??

The fcc limits power to 1500w. A repeater amp higher than 500w cannot be
found. A tube amp on a hill can -never- be trusted: period.

The factor limiting power output would be the limit placed by the owner
of the site you repeater is located, to prevent trashing other systems on
the hill. And of course a circulator is in order here.

Not quite. The 2135 is the key for the mobile radio case. The key for the
Motorola base station cabinet is a 2553.

Both of these are standard Chicago Lock key codes; if you can't get one from
your friendly neighborhood Motorola shop, just get your locksmith to cut you
one by number.

Jim, et al...

After working an HF position (40 phone) at Field day this year for four hours, I understood why we need digital signal processing... I bought a W9GR kit about eight months ago and had it put together but I never got around to mounting it in a box and trying it...

Last week I finished mounting it in the box and for $125 it is GREAT... It is not as good as the $300 TimeWave and JIR units I have heard but it is GREAT for $125... It really eases the fatigue of listening for long periods of time... I mounted mine in a RS box and put a speaker and two stereo headphone jacks in it... Everyone should do that... Also put a switch on the speaker to switch it off and on... Then plug the whole thing into your HF rig and use it...

I listened to the JIR and TimeWave units at Dayton last year and the MFJ at Dayton this year and all are better than the W9GR at white/pink noise suppression... However there doesn't seem to be any difference in the heterodyne suppression... I didn't check the filters in TimeWave and JIR, but the W9GR seems to be more than adequate in that department...

Get one and play with it... You'll surely be able to sell it at a hamfest for the price you have invested if you do a nice job of construction...

I am a ham operator (Technician license since 1990), a private
pilot, and a physician. I am on-call one week out of each month
and as a rule will not pilot an aircraft when I am on call
because I cannot return my pages while airborne due to restrictions
on cellular phone use. So I wonder:

1. What would it cost, roughly, for me to set up my own
personal ham-band autopatch to make phone calls from the air
in the local vicinity where I live?

2. Are there any ways to economically encode/decode my transmissions
so as to not violate patient privacy?

3. Does anyone know of any economical non-ham solutions to
this dilemma of placing a phone call from an airborne private
aircraft?

In my opinion, amateur radio would not be a good form of communication to call the hospital or patients while you are on call. My dad, also a doctor, asked me if it would be possiable to use one of the local repeater autopatches to make calls while he was on call. Although the rules on "business communication" are much more relaxed, doctor calls would probably not be considered legal communication under these new rules. According to QST [September 1993, p9], you can now do things like order pizza, call home and ask if anyone needs a loaf of bread and call your dentist to tell them you will be late.
"The focus is no longer on the content of the communication; rather, it is on whether the amateur, or his or her employer, stands to benifit financially. If so, then the communication is still prohibited. If not, then the remaining question is whether the communications need is one that ought to be met by some other radio service. Here the rule of reason applies. A need that arises on a regular basis, and for which other communications services are reasonably available, should not be met by amateur radio. The FCC declined to define "regular,"..." [QST, Sept. 9, p 9].
As far as encoding/decoding, it is my understanding that it is against FCC rules to code messages so others cannot decipher them. Codes like CW, packet, RTTY and the like are all decipherable by others with the equipment. I suppose the whole reason behind that one is to prohibit people from conducting business over amateur radio - seeing as how amateur radio is a self-policing communicaions form for the most part.
I don't know how possible it is to have a celluar (sp?) phone in an airplane. I guess the best way to find out would be to call the phone company. And as long as there are no FCC or FAA rules against it (I don't think there are any), you could install a cell antenna on the bottom of your plane and use that as a phone when you are on call.
This is just my thought on the subject - since you asked.

Good luck...

I have a mod book that has a mod for the Kenwood TH-28A. It involves removing three diodes and installing two (the same as the ones removed). Your radio uses surface mount diodes and other chips (the really small kind that makes you wonder how the heck you are going to do the mod). Email me if you are interested - maybe I can fax you the mod or something. It doesn't say what freqs you are able to get with it - but it is probably more than you have now with just a keyboard mod.

I am in the market for a Kenwood TM-742A tribander and was wondering if anyone else has done any price shopping for this rig? I phoned Texas Towers and they said they were selling them for $595 about a week ago but the price had gone back to $684. I only want the 2m and 70cm modules (will add third later). I have found them in Wilmington, NC for $628 but was wondering if anyone knew where it might be bought for a better price.

Please E-mail or post here.

Thanks,

Kenneth (WD4INE)

>POP: Persistant Online Procrastination milcom@netcom.com

I might note that out this way there are a few people who refuse to consider transistor amplifiers on a hill because the affordable ones generate WAY WAY too much intermod between their signal and the other junk on the hill feeding backwards up the coax into the transmitter. They all use tubes. That seems to be experience talking. (I do know that the Army is well aware that transistor PAs can generate noise and intermod so they include specs on tolerable limits for both these effects whereas they did not used to when tubes were involved.) {^_^} jdow@bix.com being nitpicky again.

>Champaign, Il ~ | ~
>wrfin@prairienet.org /|\

The switch under the rubber cover is VOX sensitivity. If you are using their headset with the boom-mike you want to twiddle the switch to find the position that works best.

The CAT port is hackable. It is not necessarily worth it on this IMD prone monster. Mine cost too much to toss it in the trash. But there have been times I have thought of doing so. Sensitivity is great. Selectivity is great. Sound quality is adequate if a little shy on base for guys. IMD sucks dead bunnies through garden hoses. Diatribe aside CAT is a TTL level, I understand, port for remote controling the beastie with a computer using more or less standard asynch serial signals. Someone sells a hookup for this for a skosh more money than I think it is worth it for me to buy. I think you might still see ads in magazines.

Note that you can see a little switch when the battery pack is off. *DO NOT* piddle with it. It will clear the radio completely. Then you will have to program in a multi-digit code to wake it back up in the mode you want. Oh - two switches underneath. With the slots down the one on the left should never be touched. It is used for factory setup. The one on the right is the reset. Once reset, if you happen to screwup, you must key in 443300 (US) or 4433600 (European) to make it come alive again.

Note that memory zero can be programmed with oddball splits. All the others are one common split.

Source record: 225775

I think I understand the problem with the receive range going back
to 144-148 MHz. The problem is that 144-148 MHz is the default range
for the receiver after a memory reset. In order to get the extended
range, you have to do something extra funny when you turn on the radio,
such as hold "function" AND "moni". (That's just an example, I don't
remember the true sequence, although I may have jotted it down at home).

I learned the true sequence by calling Ham Radio Outlet--someone there
knew the trick.

2751. MORE INFO: On 4.2 Ghz Spectrum Analyzer Setup for Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-11 14:37:36 UTC
From: cheungwd@esvx11.es.dupont.com
Message-ID: <1994Jul11.143736.21605@es.dupont.com>
Source record: 225779

As of Monday July 18th, the Spectrum Analyzer, Freq Counter, and Signal Generator is STILL HERE. And I've been a bit overwhelmed with the response, both on my phone and thru E-mail.

Anyway, I can't answer everyone individually at this early stage, as it'll take all day. A lot of you are asking for more information about the set, so I'll take some time to describe it.

Spectrum Analyzer

Tektronix: Model 1L20 goes from 10 Mhz to 4.2Ghz and you can get signals tuned/measured accurately to within 100Hz provided you use an

accurate marker signal.

The spectrum analyzer unit is housed in a Tektronix 547 solid state oscilloscope mainframe. It is, therefore, about 2 ' high 16" wide and 2' deep (only eyed it). It weighs about 50lbs. It comes with a crank style tuner, which rotates an analog dial of frequencies across a needle. There are also a series of switches to adjust the bandwidth of the

tuner down to 1Khz-full screen. It also has a series of

dB marked attenuator switches to make sure you don't overload the unit.

It is not calibrated, but places such as Tucker Electronics could do it for around $800. I have been extremely pleased with its stability. Once you place a signal on the display, it shows absolutely NO DRIFT. If you leave the settings untouched turn off the unit, come back and turn it on, everything stays the same.

Current Tucker Electronic Price:
I purchased this unit 2 years ago for $847 and I only used it for about a month before moving on to other things.

Frequency Counter

Since the spectrum analyzer was not calibrated and I needed to locate frequencies to within 100Hz, I purchased a modern digital frequency counter. This unit is 2 years old and measures from 0 to 1Ghz.

Now all I had to do was combine with a frequency generator and I had a signal of known frequency which I could use as a marker signal on the spectrum analyzer to match up against a signal I am trying to

tune or measure.

This unit is compact and weighs about 1 pound.

Original Cost at JDR Electronics:
$279

Signal Generator

Nuclear Electronics 0 to 420 Mhz. As the name implies, this is a heavy duty unit and delivers much higher output than the modern signal generators.

It is almost as big as the Spectrum Analyzer and weighs about 30lbs. Since it is vacuum tube based, it will drift in time as it warms ups. It is probably is the weakest part of the set, but it gets the job done for the lowest cost.

Original Cost at Tucker Electronics
$149

My total cost was over $1200 in assembling this set. I've already had some starting bids at $400 come in, and I will, therefore, entertain higher bids.

The effort and cost of SHIPPING will also come into play. I live outside of Wilmington, Delaware.

That's about all. I plan on moving out by August, and don't care to lug the units with me. So I'll probably be making a decision by early next week. I'll post when the set is sold.

Wilson Cheung

Please try to restrict your responses to E-mail only, as you've been overloading my answering machine. But anyway I can be reached at

2752. Defeating AGC on R-2000 Kenwood

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-11 15:13:38 UTC
From: wsears@phantasos.lpl.arizona.edu
Message-ID: <WSEARS.94Jul11081339@phantasos.lpl.arizona.edu>
Source record: 225777

Greetings,

I am trying to set up a system for listening to Jupiter on HF,
especially for the 'Comet Crash' of Shoemaker-Levy/9 in a few days.
However, the Kenwood R-2000 receiver that I have does not have any
easy way of defeating the AGC. This is bad from a science point of
view since the audio levels are exactly what I want to measure and
having the AGC changing the gain on it's own would corrupt the data.

Does anyone know of a way to defeat the AGC on this rig? I've looked
over the schematic and it does not seem to be as easy as cutting the
wire between tha AGC and the IF amp, since some biasing is also going
through that line. Besides, I would really prefer to use what someone
else has already shown to work.

All ideas and suggestions welcome. Please email if that is convienient.
I will summarize.

73,
KG7IO

2753. SUMMARY DSP algorithms

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-11 16:27:42 UTC
From: steve@hi.com
Message-ID: <steve-110794122128@brainiac.hi.com>
Source record: 225780
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Here's what I've heard so far regarding the denoising algorithms in the popular digital audio filters. None of this is confirmed, so take it with a grain of salt.

The Timewave unit uses the LMS/short-time correlation algorithm, but with a 16-bit converter.

The JPS NIR-10 uses an FFT/threshold/inverse-FFT algorithm, where FFT frequency bins that are below a threshold are set to zero. Some say that this produces more audible artifacts than the LMS/short-time correlation algorithm. I can't say for sure; I've only heard the NIR-10 and no others, but it seems like a reasonable claim.

The JPS units that advertise "pink noise reduction" appear to use the LMS/short-time correlation algorithm, like W9GR's.

^^^^^^^^^^^

The Tektronix 547 is an excellent oscilloscope mainframe (I have three of them)
however, it is not solid state. There are at least 30 tubes in each of mine.
To my knowledge, there is no solid state mainframe that would accept the 1L20.

From: cummings@u.washington.edu
Message-ID: <2vrug8$5m1@news.u.washington.edu>
Source record: 225784

I just bought an Icom T21A, and I love it, except for the teensy little antenna. It just doesn't seem to cut the mustard. Can anyone tell me their experiences with HT antennas made by other companies? I have an AEA hotrod that I used on my old HT, but it seem too heavy for the little mount on the T21A.

Also, anyone know where to get an adapter so I can put a BNC on that little threaded connector the T21A has? When I ask around here, I just get a shrug.

Thanks in advance.

2757. UPDATE ON SPECTRUM ANALYZER SALE

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-11 18:38:09 UTC
From: cheungwd@esvx11.es.dupont.com
Message-ID: <1994Jul11.183809.1936@es.dupont.com>
Source record: 225785

OK, I've got some people asking if I'd be willing to split
up the set. The answer is yes, but only for the spectrum analyzer.
So far, as of Monday JULY 11th (sorry about mentioning the 18th),
I've got two bids at $400 from CA, and two more locally at the same
price. The best bid gets a spectrum analyzer (with or without the
extra stuff).

I've got a bunch of other requests for more info coming
everywhere, including across the seas.

I will feedback the bids as I get them, so you can decide if
you want to bid something higher. I'll be making final decisions
in about 2 weeks.

Unfortunately, if you are to use ham bands, you cannot encode or
decode... that be the law under part 97... you may be better off using
gmrs systems.

2763. Looking for Handheld Personal Radio Transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-11 21:45:40 UTC
From: No.E-Mail.Available
Message-ID: <1994Jul11.214540.8565@newsserver.rrzn.uni-hannover.de>
Source record: 225788

I'm currently on the market for a wlakie-talkie type transceiver, and was wondering if any of you had any suggestions. My target price range is less than $1000 for a pair(or less than $500 for one). My main concerns are range, sound clarity, and size. Thanks.

2764. Opening up Kenwood battery pack

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-12 00:05:30 UTC
From: jdc3538@ultb.isc.rit.edu
Message-ID: <1994Jul12.000530.18018@ultb.isc.rit.edu>
Source record: 225787
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

I'd like to replace the NiCad cells in the battery pack for
my Kenwood TH-77A. It's the standard PB-6 pack. There are
no screws visible, and none under the "Kenwood" label on the
side. An experimental pry along the seams yielded nothing.

Is this a lost cause? It looks like the entire thing was glued.
At least Radio Shack had the decency to use screws. Any
ideas?

73...Jim

2765. Reduction of computer-generated RFI (long)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-12 01:44:39 UTC
From: dgf@netcom.com
Message-ID: <dgfCst0uG.KEr@netcom.com>
Source record: 225791

This post is about my solution to a severe computer/ham-shack RFI problem, and altho it mentions a commercial product, it's not intended as an endorsement (I have no connection with the vendor other than as a customer). The solution worked well and I decided to share it. No offense intended!

My old 386DX40 tower PC generates tons of RFI and could not be operated in the shack while on the air (the computer was OK, the receiver was not!) About a month ago I decided to try remoting the computer from the keyboard and display, and was told about a device from "cybex" corporation. I obtained their model EXV0 from a local LAN hardware vendor, along with 150 feet of shielded multiconductor cable (the distance limit for the EXV0, along with the distance from one end of my house to the other). I assembled the cable and installed everything, and lo and behold, the RFI was nearly gone. What RFI remained was emanated directly from the VGA monitor (monitor power off = no RFI, and interestingly, monitor power ON but no video drive = no RFI, but monitor on and operating still generated a modest but tolerable amount of RFI, detectable only on an ICOM IC-202 with it's internal whip antenna located about 1 foot from the monitor case, and even then, not too much).

The only problem at that point was poor video quality and some interaction between keystrokes and the video display (a bit of jitter on the display when pressing a key). Another trip to the vendor yielded a (very expensive) cybex brand assembled cable (again 150 feet). On installing this cable the video artifacts have disappeared except for somewhat reduced maximum video intensity/contrast. By the way, cybex specifically advises against using other than their cables, but they _do_ specify a standard belden part number in their documentation. The cable from them was ~ the same price as the same amount of belden 9936 from newark (= too much $!).

I'm using only 640x480 standard VGA mode and 80x25 character mode. I haven't tried any of the SVGA modes and doubt that they would be satisfactory.

There are other brands of "vga extender" products available, and I'm sure they vary in sophistication and video quality. The product I obtained was the cheapest thing I could find to do the job, and it seems satisfactory. There is absolutely _no_ technical info in the manual, including no schematics. I did not try opening either the sender or receiver box to see what's inside, but I doubt there's much to it.

I hope this post is of some use to other RFI-plagued hams -- I'm happy now that I can run the computer in the shack without RFI problems (and as a side effect, there is no longer any noise or heat in my shack from the computer). The hassle of not having the FD or reset button nearby is a worthwhile price to pay for the absence of RFI.

Again, I have _no_ affiliation with the vendor other than as a one-time user of one of their products, and I would encourage anyone considering remoting their PC as an RFI solution to look into all available equipment vendors.

For $1000 for the pair, you can have virtually any pair of FM 2m or even
a pair of 2m/70cm HT's (they're called handy-talkies, not walkie-talkies)
you want. Drop by the closest Ham Radio Outlet or similar ham store
and take a look. You'll have quite a selection!

>2. Are there any ways to economically encode/decode my transmissions
>so as to not violate patient privacy?

I believe that conducting patient/doctor conversations would be in conflict
with the non-business intent of amateur radio unless your patients have not
and are not reimbursing you for your professional services (e.g. volunteer
services). Any attempts to conceal/encrypt conversations would also be
in direct conflict with regulations. Amateur radio was never intended to be a
private mode of communications--it's more of a sociable communications
community.

>3. Does anyone know of any economical non-ham solutions to
>this dilemma of placing a phone call from an airborne private
>aircraft?

The most appropriate solution I can think of is an AirPhone, which is an
inflight phone system. I don't know what the operating cost is, but based on
the relatively low volume of units produced/used (compared to cellular
phones), I suspect that operating costs will be relatively high.

Perhaps consulting a good radio communications shop would yield some
acceptable alternatives.

I get the impression that you prefer to adhere to restrictions placed on radio
usage--hence your reluctance to use your cellular phone while in flight.
THANK YOU!

2769. Mobile duoband rig with aviation band ?

Source record: 225697

With all the current interest in DSP, has anyone thought about using one of the 16 bit soundcards? It should be able to run a 40khz sample rate, and many people already run their rigs from the computer. I have no idea what it would take to make it work, it just seems that the main differences between the store bought units is the software, and a 16 bit sound card should supply the hardware.

Besides, I've been looking for a excuse to upgrade my 8 bit card... hi hi

Surely you jest. Conducting business (weather on an Autopatch or not) is
illegal on Amateur radio. The test is: Do either you or your employer
benefit.

RK> 2. Are there any ways to economically encode/decode my transmissions
RK> so as to not violate patient privacy?

Get yourself a copy of part 97, the FCC rules governing the Amateur
Radio Service. Codes and ciphers are specifically excluded. See
97.113(d). ALL communication MUST be in plain language. (CW is
considered to be plain language, not a code).

RK> 3. Does anyone know of any economical non-ham solutions to
RK> this dilemma of placing a phone call from an airborne private
RK> aircraft?

RK> Richard Kaplan

It is really difficult for me to understand how ANY ham (that
passed the necessary tests required to become an Amateur) could think
what you want to do is allowed. This is a joke, isn't it?

2780. Re: Opening up Kenwood battery pack

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-12 16:37:45 UTC
From: wa2sff@arch4.ho.att.com
Message-ID: <Csu66z.5o4@nntpa.cb.att.com>
Source record: 225703
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

The PB-6 pack is glued together. On at least one of my packs, the
glue joint was weak on one side of the pack. Also the glue joint
appears to be spotty rather than continous around the joint.
I pushed on the joint with a needle nose plyers. That broke the joint.
I then made a tool by bending a ground lug into the shape of an L.
I was then able to slide the ground lug around the joint on three
of the four sides (top surface is not glued).

The pack then opened up. I replaced the cells and wrapped them with
double sided carpet tape and put the case back together.
I used no glue, just the double sided tape.

I had a small amount of damage on the case where the solder lug
slipped, but overall, no worse than scratches from use.

Alternate solution:

Haven't tried this one. I was told that putting the case in the
freezer makes the glue brittle and then the glue joints will break
when hit or pushed on with an object.

Surely this is a mistake. I have a GE Mastr II 250 watt UHF amp on a mountaintop and it's been a lot more reliable than any of the solid state PA's of the other repeaters I maintain, including Henry, TPL, and Motorola. It just sits up there and does its thing day in and day out. And it's squeaky clean. Transmitter noise is so much lower than the solid state PA's, as is IMD. It runs a little under 250 watts into a 4-cavity duplexer (about 100 dB notches), and the receiver leg has a GaAsFET preamp, and there is *no* desense or transmitter noise problems ever. I have two 75 watt UHF Micor repeater stations with continuous duty PA's, and they are much noisier and have been known to go spurious on occasion. The sounds that a UHF Micor makes when the PA is throwing a fit are very distincitive - anybody else that has heard it knows what I mean. I'll keep my tube PA's.

Hi Jim, I was at a hamfest this weekend and I asked Mr. Nicad himself
about the Kenwood pack. He said that it is virtually impossible to open
it without destroying it. He sells repacks for it, but he said for the
grief involved most people just buy a new unit (I think his price was
about $45).

Nonetheless, I plan on tearing into mine rather than just throwing it away.

Tom, buddy. I service the coast guard electronics in the pacific northwest for a private contractor. Take my advice please. If you go out on the water get yourself a vhf radio. A lot more people dissapear on the water than you ever hear about. Sorry to get heavy but watching people cry and the anguish involved all for the want of some sort of reliable communication. It gets to you.

> Mike, N4PDY

I have been able to open some battery packs by breaking them open. The advantage is that there is no kerf, that is, gap caused by the cutting instrument. I have found the best way to break the case is to put it into the vise and apply pressure in the right spots. It usually breaks, or cracks along the glue seams. You may have to do some additional prying with a screwdriver to completely open the case. Some battery packs use very strange cells that I have not been able to locate.

Hope this helps.

2789. ? about Yaesu FT-5100

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-12 20:27:58 UTC
From: txb00@amail.amdahl.com
Message-ID: <9407121227.AA58748@txb00-mac1.George>
Source record: 225710

Info needed:

I recently purchased a Yaesu FT-5100 Dual-Band mobile unit. I did the out-of-HAM-band mods on the unit.

Now, my question is, while I was setting the low and high frequency range, (VHF 128mhz to 180mhz and UHF 420mhz to 475mhz as per instructions) I noticed that on VHF the display can be set from 20mhz to 300mhz on VHF and 300mhz to 600mhz on UHF, but if I try to monitor something out of the mod range, say in the 488mhz area, I can hear anything above 475mhz.

Is there a mod to extend the receiving range above 475mhz or is this as high of a frequency you can receive on this unit?

I also modified my FT-530 Dual-Band Hand Held and it can receive all the way up to the cellular band with out any additional mods.

Thanks in advance for all your replies-

Hello folks

Has anyone used the new Kenwoods TH-79 and TM-733?

How do they compare to the TH-78 and TM-732?

Any comments?

: need are range and sound clarity. Thanks.
:

Adam, you could certainly use a pair of ham radio HT's, however,
you will need to study for and take a test for the required
Technician ham license.

If you are not interested in getting a ham license, you might find
the new General Mobile Radio Service (GMRS) radio's of interest.
There is no test required, but you do have to have a license
(last I checked it was about $35). These are designed for
small businesses and even families (at the beach, between two
cars on a trip, etc).

Radio Shack (and others) carry GMRS hand-held radios, well
within your budget. The range between two hand held units
can be anywhere between hundreds of yards (urban area) to
a few miles (open land). However, GMRS repeaters are being
set up to allow more distant communication. Repeaters are
higher powered radios that take your hand-held radio signal
and re-broadcast it from a tall antenna tower, giving you
much greater effective range. GMRS radios operate in the
400MHz range, and are FM. This should give you fairly
clear, dependable sound.

Hope this helps.

Mike

Radio Shack has some nice (heh heh :) walkie-talkie type transcievers, and
they should meet your budget. They have 49 MHz walkie talkies for under
$100 a pair. What a deal!!!!!! CB's might also work.

Ya know, I kind of wonder why nobody responded to you!!! ;)

I'll try the cold/break glue method, then go for more destructive
techniques.

Here's another criteria for selecting HT's: Look for one that lets
you easily replace the cells when they finally die. Icom/Radio
Shack win on that one. Are there any others that use screws? Are
all the aftermarket packs assembled with screws, or do they glue
too?

It is against the rules to operate a cellular phone in an aircraft in flight... This is an FCC rule, not an FAA rule... As a charter pilot, I have to inform my passengers that the use of their cellular phone in the aircraft is prohibited...

And why is this... Because from altitude, a 1/2 watt cellular phone can lock up hundreds of cells for miles around, instead of just the one or two that it can see from the ground... It has been estimated that 700 or so airborne cellular phones stratigically placed around the country can lock up the whole cellular system nationwide...

At least two Japanese companies make some. Tokyo HyPower Labs makes a 40/15/6m tribander for SSB/CW. And jcomm makes single-band HF SSB/CW transceivers. The biggest problem with such devices isn't their low power, but the efficiency of any kind of antenna you can comfortably use as an HT. Connected to a dipole or other "real" antenna, these units work as great QRP rigs. In fact the jcomm gizmos have quite a cult following.

I've been successful using a 2", blunt chisel in the slot where the
2 halves join. With a series of sharp blows from a hammer, I have
been able to break the weld, leaving the plastic intact to allow it
to be re-glued (now you see why a *blunt* chisel is required :-).

Good luck,

Bill, MANY THANKS for putting this into perspective for me!!
Amateur radio is a great, facinating hobby, and its worldwide brotherhood
of operators provide services that I'm proud to be a new member of.

But on the water, your radio is MORE than a hobby & service...it may be the
only rescue from loss of life to you & your loved ones.

Guess I was trying to pinch pennies by modifying my HT...while losing site
of the big picture. Think I'll visit the Houston boat show going on this
week, check out their electronics.....

Again, Thanx......Tom Baltz KC5HEG trb@cray.com

It's worth it. They're pretty cheap, anyway. But do the mods in the mean-time.

Because as a skipper and as a ham, you're doubly legally protected if what you need to do is call 'Mayday, Mayday, Mayday' and all you have is a non type-accepted rig. And if you're life were really in danger, you could always pitch the radio in the drink when help arrived, and not feel the loss too acutely, if still worried about what the CG might say.

On the other hand, in a normal boarding/inspection your ham radio handheld, once shown to be a ham radio rig and not under USCG jurisdiction, is a lot less interesting than are your flares, PFDs, and toilet.

The Coasties have been conducting a crack-down on unlicensed marine VHF. A ham rig is about the only way I can think of to have last-ditch marine VHF frequency coverage without the expense of paying an exhorbitant 'user fee' to license a transmitter that you never intend to use. And yes, the Coasties will cite you if they find a turned-off marine VHF with no evidence of transmitting, and no license. It probably violates every rule of probable cause, due process, and evidence, but hey, it then becomes your problem to go through the process of having it thrown out of Federal court. And getting the Coast Guard to make amends is like getting any other branch of the military to do so.

>Tom, buddy. I service the coast guard electronics in the pacific northwest for
>a private contractor. Take my advice please. If you go out on the water get
>yourself a vhf radio. A lot more people dissapear on the water than you ever
>hear about. Sorry to get heavy but watching people cry and the anguish
>involved all for the want of some sort of reliable communication. It gets to
>you.

Bill's right. The water gets mighty big and lonesome when the mast comes down and the rigging wraps around the prop shaft, and that sharp rock is looming ever closer...

: Can whoever knows post or email when it is?

Posting, since others may be interested.

According to information someone sent some time ago it is:

3.865 Saturday @ 8:00PM Eastern

Note that I've not been able to verify this from Colorado this summer.
Hopefully I'll be able to participate this fall when the QRN settles
down a bit.

BTW, anybody interested in setting up a similar net in this part of the
world? Surely there are other plains/inter-mountain Drake enthusiasts
out there!

: Thanks

Welcome. Always happy to hear from other Drake users.

-Here's another criteria for selecting HT's: Look for one that lets
-you easily replace the cells when they finally die.

Instead of getting regular packs, get the AA pack and load it with NiCds. It is cheaper, trivial to replace cells, and thanks to the walkman, you can find alkaline AAs anywhere if the NiCds die while working a public service event. (I know this won't be a good replacement for high current or higher voltage packs, but it works for most people.)

--> Soooooo... I hope this helps...73 de Dan -- WA0JRD

You really need to make an air-balun (6-8 turns of coax 8"
diameter or so). I found this helped my TVI problems a bit.

I picked up a high-pass filter that goes in line right at the
TV set. (cable TV input jack) Worked wonders for me.

The FT-5100 does have user settable timer. But if you are long winded
(like me :-) and actively participating in conversation then it wont
help much. However the dual batteries won't be bad :-). After every
incident I said to my self I am going to get one of those batteries
from Sears but always find the ways to spend money on some newer HT :-).

On my TH-78A a VFO reset (which seems to be a processor reset)
is performed by holding down the 'F' key while powering the HT
on. Be sure to hold down the power button a half second or so
until the reset occurs. A fast finger on the power button will
power the HT on without a reset.

> if you use one of these monsters!

My brother got a DX-40 early in his ham carreer, but it wasn't until after
I got licensed that we really had a chance to try it. I was shocked (!) when
I found that the cathode-keyed circuit had nearly 600 (!) volts across the
key contacts key-up. Using a straight key, you'd also see a few small sparks
as you sent. I considered this method of keying to be completely unsafe.
Eventually, I converted the DX-40 to grid-block keying, and it worked pretty
well. Sounded much better with the grid-block, but I did have a problem with
the capacitors in my negative voltage supply occasionally self-destructing.

Source record: 225745

I have a Hallicrafters, inc. Model SX-28 Super Skyrider receiver. My grandfather gave this to me after I passes my no-code tech exam. He tells me that it was made in 1951 and he got it as surplus equipment after his term in the army from World War II. The unit is a rack mount and I cannot physically pick it up myself (and I am a big guy!).

I'd like to know if this is worth anything. I understand that there are people that collect old radio equipment and are interested in this type of thing. I have absolutely no idea what it is worth and may be interested in selling it. If you have any information, I would greatly appreciate it.

Thank you very much,
Matthew Appler

Tony, if it's no problem getting one from US source, then there is
at lease one company who sells PC-based scanning receiver.
Unfortunately, it doesn't cover 70cm, according to the ad I've got
here. (Maybe they have other products, but I don't know.)
It has separate external receiver and DSP/control card, and
graphic user interface looks quite nice. Here is the spec:

Freq. range: 0.5 to 30 MHz and 108 to 174 MHZ
Tuning reso: 1 Hz
Modes: AM, Synchro AM, FM, CW, CW-NB, CW-TT, LSB, USB
Image rejec: >90 dB (HF), >50 dB (VHF)
Dynamic ran: 97 dB

ComFocus Corporation
6160 Lusk Blvd
San Diego, CA 92121

Probably your ham license. Seriously, you can't use your amateur
license for business related purposes, especially if it is YOUR business.

>2. Are there any ways to economically encode/decode my transmissions
>so as to not violate patient privacy?

No, because the amateur regulations prohibit scrambling of ham radio
transmissions. In fact if you're worried about patient privacy, ANY
radio-based communication is subject to being monitored by a scanner fan.

>

There hasn't been much posted on alternative solutions to this problem.
(Well, maybe the AirPhone would do it, but I thought that was designed
for use on airliners.)

I don't know what the alternatives are myself but try looking in the
Yellow Pages under "Radio Communications and Equipment Systems".
Look for display ads that say things like "800MHz trunking",
"telephone interconnect", "privacy". I don't know if any
of these systems could be legally used from an airplane
but it is an alternative to cellular phones that you could
check out.

Anyone familiar with these systems?

: N2VNO

They use ultrasonic to fuse-up the battery case for
a waterproof (and lower cost of course). If you
think screws is a good idea you have to think about
who pay for that screw first.
OK! Back to your PB-6, if you want to open it up,
you need a thin blade, point it to the fusion line,
give it a hit with a hammer. For a better result,
you need some practice. DON'T hit it too heavy or
you'll break it into pieces. Use chloroform to
stick it up after you replace the NiCds if you're
luckily to find some.

I recently purchased a used MA550, the 55-foot tubular crank up tower.
US Tower has a "company policy" that "we do not support used equipment"
(told to me by them over the phone). They refuse to provide any datat(
and suggest I "hire a professional tower installer". Nice people. Guess
some companies still have a lot to learn about customer service. Anyway,
I need an assembly manual, diagram, etc., so I can piece this thing back
together. I'll gladly pay any reasonable copy costs or copy your manual
and return it. Thanks!

I have been considering getting into a 2-metre rig for backcountry emergency use. I have asked for recommendations and a few people suggested the Realistic HTX-202 (?) is a great value. Well, it just got better. RS has cut the price by $70 to $229. I don't have my FCC license yet but will soon.

The price is mighty attractive. Am I jumping the gun purchasing this radio at this time? If this radio is highly acclaimed, I would be willing to trust the judgement of practicing hams. Ought I buy this radio or hold off. I don't mind spending more for a better HT.

Any comments? E-mail appreciated.

Not sure about the HTX-202, but they have the HTX-404 (440MHz version)
on sale right now for $229. Is that what you saw on sale?

: >Do any companies manufacture hand held HF transceivers?

: At least two Japanese companies make some. Tokyo HyPower Labs makes a
: 40/15/6m tribander for SSB/CW.

I've actually held one of these when they were first displayed at the
Harumi Ham Fair in August 1992 - their physical size and weight reminded
me of some of the old two meter Standard HTs that were on the market
back in 1975 or so. They are substantially larger than any HT you'll
find on the market today and, of course, much heavier. The three units
I saw were all prototypes as Tokyo HyPower was still trying to figure out
if there was a market for them. I have no experience actually using one.

: And jcomm makes single-band HF SSB/CW
: transceivers. The biggest problem with such devices isn't their low
: power, but the efficiency of any kind of antenna you can comfortably use
: as an HT. Connected to a dipole or other "real" antenna, these units work
: as great QRP rigs. In fact the jcomm gizmos have quite a cult following.

Actually, these rigs were first designed and manufactured in Japan by
Mizuho. There are monoband rigs for, as I recall, virtually all bands
including WARC, from 80m thru 6m. At the peak of Cycle 22, a friend here
in the USA worked a JA walking down a street in Tokyo on 10m. More
recently, I worked a fellow (WC4X/bm) on 18MHz who was operating
as "bicycle mobile" clear across country .... he was using one of the
Mizuho rigs. The Mizuho rigs were available in kit form not too long
ago (maybe still are).

After looking thru one of my JA CQ mags, I see that Mizuho also offers
a 144-146 2mtr SSB/CW 1-watt output rig called the MX-2F for about 38,800
yen (close to $400). Their other HTs appear to cost about $320-350 or
so. They also used to make nifty little 10 watt amps for most of their
HTs. In recent years, they may have licensed others to manufacture
the various units, but I am not sure about that.

Contact info for Mizuho is:

Mizuho Tsushin Co. Ltd.
2-8-6 Morino
Machida-shi, Tokyo 194
JAPAN Fax: 81-427-6793

I hope this is enlightening for somebody ..... ;-)

I got mine for about $189.00 back in april. I know of quite a few hams who have them. I do think that "Out of band receive" would be nice. The weather on 162.55 would be a good thing to have. It works quite well as an ht, I also run mine mobile and at home with external antenna, power, external triaxial speaker and a hand mike. I have had no problems with mine, nor has anybody else who I know "face 2 face". I have heard horror storys about radio shack, but also horror storys from every mfg of equipment so take your pick, anything can break.

I think that ICOM & kenwood also make nice rigs. You might have better use from something that can get you weather freqs while out on the back woods. Advance warning so you can get to safety is better than calling for help in the middle of a blizzard {:-)

It's not the USCG doing the crack down. It's the FCC. $8000 per NAL.
Also, the USCG is subject to constitutional niceties such as due process
only when operating on inland waterways. The US Supreme Court has ruled
that there are NO constitutional rights at all once you get off the land
and on to your boat if it is in the ocean. And, yes, they do issue NALs
for not having a license because the license is a Ship/Aircraft Station
license. If there is an unlicensed radio aboard a boat it is in
violation of FCC rules. The Seattle FCC office is in the forefront of
this increased enforcement but hte new administration is encouraging the
other 42 offices to get with the program and generate some revenue.
Boat/US has been fighting this in court for years with no success.

Where I keep my boat I'll bet there are fewer than 10 percent of the
boats in compliance. Conversations at yacht club meetings and events
indicates to me than most folks don't even know they are required to
have a license. OTOH, with the fees going up to $110 I doubt if many
will get the license anyway.

There are HT's for the HF bands. They're made by a Japanese company called Mizuho, (not sure of the spelling) and they make a model for every band 80 through 6. AEA used to sell a 6m ht, but it was just a Mizuho with an AEA label on it.

The radio you are referring to is the HTX-404 at that price. The 2 meter
rig sells for $259 but when it goes on sale is usually about $188.

2852. Antenna safety

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-15 04:42:40 UTC
From: glass@leland.Stanford.EDU
Message-ID: <305440$a5j@nntp2.Stanford.EDU>
Source record: 225671
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I need to mount an antenna for a 900 MHz spread-spectrum radio link.

According to the manufacturer of the radio equipment, it works best when antennas are on a direct line of sight. However, because the building where the antenna will be is only 18' high, and some of the surrounding buildings are taller, it will need a tall mast or tower.

To figure out how high the antenna needs to be, I made a crude sextant from a yardstick, a protractor, and a photo tripod. After a few observations and a little math, I determined that one nearby building with a flat roof (plus a small shed on top) was about 30' tall at the roofline, with a chimney about 41' high. (Since local codes require the chimney to be the tallest part of the building, it should end higher than the shed.) Another building in the area, an old Victorian mansion, came out to be about 54' high at its tallest spire.

The area where the antenna will reside is subject to strong winds all year round, so the mast or tower will have to be steady and strong. There's an average of one thunderstorm per day during the summer, so lightning protection needs to be good. The lot on which the building sits is 66' across, and there are high voltage power lines in the alley about 6' beyond the property line. The building butts right up against the opposite end of the property.

The antenna itself will be an omni with 9 dB of gain -- fairly expensive, but necessary to give it a good reach even when it's iced over.

What's the best method of mounting the antenna safely, securely, and high enough to work? The local Radio Shack said it had a 39' mast designed for TV antennas, which could be mounted on the roof using an eave or tripod mount. (The resulting height would be about 57' -- just about right.) But of course, I don't trust Radio Shack to know anything about antenna safety, or mounting it to resist winds. They also drew a blank when I asked about grounding and lightning protection.

What do I need to know to get the antenna up (and have it stay up)? How can I avoid having the building burn down if lightning strikes? How can I protect the digital transceiver at the end of the coax? And what precautions, if any, need to be taken about the power lines?

Any info, advice, comments, and pointers to literature would be much appreciated.

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

2860. Need power supply advice

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-15 11:48:51 UTC
From: dhughes@prairienet.org
Message-ID: <305t33$n5s@vixen.cso.uiuc.edu>
Source record: 225679

I bought a Kenwood TH 215A handie-talkie at a hamfest
last weekend, but it did not have its original power supply.
The original is 10.15V @ 42.5mA.

Just how close do I have to be? Would I be effective (and safe)
using a 12V @ 500mA? Is the amperage critical, or does the
battery take what it needs and ignore the rest?

Thanks for any help! ---Dan

I am posting this for Randy KC9W who doesn't have full Internet capability but does have an E-mail address at : randy@genie.geis.com

Randy has a 48 foot self supporting tower that needs to be taken down as he is moving. You get to keep the tower and he will keep the beam and rotor. He lives in Hammond, Indiana, so if you are close to him you can get a free tower. It is my understanding that it is in good shape with a few rust spots.

He also has a complete Ten Tec Omni C for sale. Price is negotiable.

Randy can also be reached at home at (219) 845-1013.

If need be I can pass along any replies to Randy.

>about 6' beyond the property line. The building butts right up against
>the opposite end of the property.

Check with the local building codes for grounding information. They might also
have some regs on antenna location to power lines. The safe way is to locate
the tower so that it could not hit the power lines even if it does fall.

>The antenna itself will be an omni with 9 dB of gain -- fairly expensive,
>but necessary to give it a good reach even when it's iced over.

You need to know the wind load for this antenna.

>What's the best method of mounting the antenna safely, securely, and

>tank-like though. What would 40M performance be like with a duck antenna?

>Dave Bashaw
>wa6qwl

In Arizona at a hamfest several years ago, a guy had been working at
the handheld division of Motorola and made a 40M rubber duck just to try
it. The antenna was about 10" long, 1.5 " diameter at the top which
tapered to a male UHF connector. He said that the performance was fair
to poor, and that a dipole would have been much better.
On the other hand, K0CQ here in Ames designed the Rush Radio that
picks up Limbaugh's shortwave broadcasts on 19M. The antenna is an
active loop that is tuned to the one specific frequency, and yet only
occupies the back side of a standard-sized AM radio. K0CQ does say,
however, that the bandwidth on the antenna is very narrow, and that 25
khz off the center frequency gives lousy results.
Look at it this way: it is possible to make a short antenna, but
expect to make tradeoffs, either in performance or bandwidth.

Hi Greg!

I have had my HTX-202 for a couple of months and am very pleased with it.
Unless you are in a big hurry though, you might wait a little while for
another sale. I bought mine in May on sale for $188.00. With a new lower
base price, who knows, maybe they might even go lower. That would be my
luck :-).

Amateur receivers are usually much more selective than commercial rigs, since commercial stations operate on fixed frequencies and do not have to fight QRM. Normally, amateur receivers also are capable of operating in a larger variey of modes.

Commercial transmitters, however, are built for near 100% duty cycles and are much more rugged.

I have actually seen a HT for HF in the QST magazine a few years back.
It had an antenna connection for a light weight dipole antenna.
It also had a connection for a CW key. The HT had no PLL frequency control,
so you had to change crystalls if you want to change the TX/RX frequency.
There was a RIT control for a minor frequency shift. The rig was
monobanders.

Please look back a few years in the QST magazine for fulll info.

Many of us tried, but your posting contained a return mail address which is invalid. Try mailing yourself something from another site. I notice that spookey.eecs.wsu.edu is not a registered internet node. You either need to have your machine registered or find some way to post with your internet address.

I wish others would check this as well. About 10% of the time I try to respond to postings they bounce back due to unregistered internet names even though we utilize domain same services off the internet.

> 0 responses
The answers to these two depend on your personal preferences. I don't do packet (too many computers at work).
>3) Should I buy new or used?
> 0 responses
How much money do you want to spend? Do you want the warranty, or can you fix it yourself?
>4) What NEW VHF radios have the most "bang for the buck"?
> 0 responses
>5) What USED VHF radios have the most "bang for the buck"?
> 0 responses

This 'bang for the buck" phrase is somewhat ambiguous. Do you want output power, memeories, 9600 baud packet, small size, built in duplexer or two output tails?
There are so many new and used rigs around, but not many used ones for sale, so ask some local hams who have experience doing what you want to do.
I have an Alinco DR570 in the car, an Icom IC24AT HT that I can hook up at home and an old Kenwood TS-700 multi-mode 2m at home. I like 'em all, but I wish I had more memeories in the Alinco (it has 10 per band) and the Kenwood did repeater offsets on the 145 band, but the 24AT'll do inna pinch.

The Kenwood TH-78A recieves down to 118 Mhz without modification. It's sensitivity is less than .32microV on it's sub band and less than .16microV on the main. In my opinion a very nice radio. Kenwood just came out with the TH-79A which replaces the 78A. Right now they are about $80 more than the 78A, but they should drop once Kenwood gets rid of all its extra 78As. The only real feature differences between the two is the 79A is smaller, doesn't have a backlit keypad, does have an "on-line" manual (I guess in case you bump your head and forget how to do offsets). They both put out approximately the same amount of watts. I would tell you more, but I can't seem to find the info I got from HRO a few days ago. If you want to know more about either one - you can email me. THIS IS ONLY MY OPINION ->I am not too impressed with what Icom has been putting out these days. I have a 2GAT and really like it - kind of disapppointed that they discontinued them - oh well. Well, that's what I know about the Kenwoods. Hope it helps.

2875. Looking for Handheld Personal Radio Transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-15 20:08:18 UTC
From: No.E-Mail.Available
Message-ID: <1994Jul15.200818.8829@newsserver.rrzn.uni-hannover.de>
Source record: 225558

I'm currently on the market for a walkie-talkie type transceiver, and was wondering if any of you had any suggestions. My target price range is less than $1000 for a pair(or less that $500 for one). My main concerns are range, sound clarity, and size. Thanks.

BTW: Currently, I have no e-mail access, so please post all replies to the newsgroup. Thanks.

---Adam

2876. Question on 5R4WGB Rectifier Tube

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-15 20:17:05 UTC
From: liles@bitinc.com
Message-ID: <306qs1$cf3@rigel.bitinc.com>
Source record: 225610

Hello Fellow Netters,

I have a Hammarlund SP-600 Super Pro Receiver. The rectifier tube is a 5R4GY. It can also be a 5R4GY/A and a 5R4GY/B--these last two alternate tube types can be easily understood. Recently, I bought a 5R4WGB from Antique Electronics in Arizona--it was on sale. The 5R4WGB is a JAN tube, but that is not a surprise because many of the tubes in old radios are JAN tubes. Can someone provide some information on this 5R4WGB tube. We tested it on a tube tester and it tests fine. I have not tried it yet in my SP-600 because the tube that it currently has is OK. Just for more information, the 5R4WGB was made by a company with "Chatham" in its name. Thanks in advance for any information, you can either email me or post to this newsgroup. I am not sure how much general interest my question is, so use your judgement.

2877. Solar Panels

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-15 20:24:17 UTC
From: davidc@lsid.hp.com
Message-ID: <Ct00oI.CFz@hpcvsnz.cv.hp.com>
Source record: 225695

I am interested in either purchasing or assembling some kind of solar panel to be part of a charging system for 12 volt gel-cell batteries.

When I was on vacation in southern California earlier this summer I noticed numerous call boxes along highway shoulders for making emergency calls. These call boxes had a small solar panel attached near the top of the pole the call box is attached to. Does anybody know what kind of current capacity these have, where they might be purchased, what cost etc.? They appear to be about the physical size I am interested in for portability etc.

Does anybody out there have any information they could share on good sources for individual solar cells or already assembled panels?

Dave Cook, KB7QCL

I'm not surprised, Kent. I Emailed you a long letter, but of course
it bounced. I tried several address variations, they all bounced too.
Give us a *good* reply address, and you'll get more response.

2879. Customized Cabling: Where to get?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-15 21:54:37 UTC
From: mjr@crl.com
Message-ID: <3070it$ggs@crl.crl.com>
Source record: 225546

I need a 6ft. long piece of 50 ohm low loss (like Belden 9913) coax with a female N connector on one end, and a mail N connector on the other. I can not build quality N connector connections by myself...

I called Pasternack in So. Cal, and they had EXACTLY what I wanted, already built, for $37 US. Unfortunately, they want $100 minimum on all shipped orders even pre-payed by credit card! I couldn't believe this policy, but they insisted they were serious...

So my question is where can I get such a piece of cable with connectors? I live in No. CA, and can order by phone from anywhere if anyone has any suggestions...

Thanks

FIRST OF ALL AN APOLOGY TO ALL... Sorry my return email address was posting incorrectly. This has been fixed. I wondered why I only had one response! MUCH THANKS TO TOM BODOH for pointing this out to me.

Thus, my correct email address is:

kjones@eecs.wsu.edu

Thus, I will continue to collect responses and write up a summary of what you all have to say... Thanks for you patience.

Galen, KF0YJ also been pointed out that the questions are subject to interpretation based on personal preferences, thus I have tried to clarify them. I realize these are still imperfect, but go ahead and email me your answers based on what equipment you have and/or would like to have...

I post the summary of the responses once they stop comming in...

Here goes:

1) What mobile radio would you recomend for someone interested in both mobile VHF communications and (non-mobile) packet radio.

2) What mobile radio has the most features (i.e. the feature you personally consider valuable) for the price. (i.e. the benefit/cost ratio, with cost being the variable to minimize.)

3) Given a price range of 50-500 dollars what new/(used in working condition) mobile radios do you like, or would you recomend getting?

I've decided that I'd liek to get into ham radio. I think that for starters I'll be getting a code free Technician license. I think I'll start off with 2 meter and the 440 MHz (is that it?) bands. What brands of radios do you recommend? What should I steer clear of? What should I expect to pay for a radio for each of these bands, both new and used?

Thanks...

Thanks for the help, here are some clarifications of what I need:

1) Mike Mayer is correct in his statement. My target usage is for communications across a college campus either between two people, or one person and a computer.
1a) A computer?? Yes, certain new Macintoshes have speech recognition. By adding a simple VOX circuit to either existing mike/speaker jacks, or actually opening the case and manually adding the jacks, I will hopefully be able to remotely operate my computer if necessary.

2) Actually, I'm in the US, I just don't have access to a NNTP server in this country.

3) My name is not Adam Leech, it is Adam Dyllon. There was some kind of screwup in the posting that caused several copies of the same message with scrambled info and the bottom message chopped off.

Thanks a zillion!

The radio shack unit has what I see as these compelling features:
-Outstanding audio reports
-Outstanding RF response - rejects interference typical in this mode/frequency
-Solid construction
-Sold/Serviced everywhere - I believe there is a good service policy
avail
-Uses ICOM accessories - many 3rd party accs avail economically
- great price

Reported shortfalls
-Operates/recieve ham band ONLY - lends to its good performance
-a bit large compared to whats out there.
-a bit light in other features compared to competitors

bottom line from a marketing guy (me) is that anytime you put something
into the consumer channel the above is typical. I would go for it.
There are alot of fans out there.

I did see it on sale for $179 recently.

Good luck. What ever you do do not worry too much about it. You can't
ever go too wrong - enjoy the hobby - you'll enjoy it.

: fast to slow range. Is there a way to restore this control to
: usefulness?

Although this isn't a specific fix, I have had success applying it to a few keyers in the past. What you need to do is change the TYPE of pot that controls the keyer. I'm guessing that the little slider is of the linear taper variety, which can become a pain in the tush in a hurry, especially if the speed you want is *right at* the point where it wants to take off. The best solution would be to replace the existing pot with a reverse-log taper; unfortunately, such an animal isn't always readily available. My solution has been to use a "normal" log taper pot, but connect it backwards. This will put your top speed at the bottom of the panel and the slowest at the top, but you'll gain a LOT of control over the 20-30 wpm range. Hope my babbling has been of some assitance.

Pasternack seems to generally have a f*ck-you attitude, and f*ck-you prices to match. $37 for the described cable is about 300% markup. Where do they find enough suckers to stay in business? I pitch their catalogue in the trash without opening it nowadays.

disgusted,

>can I avoid having the building burn down if lightning strikes? How can
>I protect the digital transceiver at the end of the coax? And what precautions,
>if any, need to be taken about the power lines?

The RS mast is actually of rather robust construction. It's sufficient
to support the type of antenna you envision, though it should be pinned
rather than depending on the friction clamps supplied. It must be guyed
properly. An alternative would be Rohn 20G with a roof mount. It would
still need to be guyed. With roof mounting, even Rohn 45 would need to
be guyed (the base isn't stable enough to resist the maximum overturning
moment). The mast needs to be mounted in such a way that it cannot possibly
fall across the AC mains wiring. This may be a serious problem at your
location. It may be best to use a professionally engineered solution.
(Towers can be engineered to fail in such a way that they fall in a
predictable direction.)

Rohn has much helpful information about towers and tower installation.
Your northern California representative can be reached at 702-322-9300.

Lightning and surge protection are mandatory. The requirements of the
National Electrical Code are only a *minimum* starting point. They
are not sufficient to protect the equipment. The minimum requirement
is a number 8 solid wire, *mechanically* bonded to the mast and run
in a *straight* line to a minimum 8 foot grounding rod. Mechanical
bonding is required because soldered joints *will* fail under lightning
strike currents. Straight runs are required because lightning is a form
of RF and *inductance* must be minimized in the grounding path or there
will be a very elevated potential at the mast connection. This minimum

installation *should* protect the building and occupants from major shock and fire hazards. It is not, however, sufficient to protect sensitive equipment.

A better ground is a 5 inch copper strap, mechanically bonded to the mast, run in a straight line, and mechanically attached to a low impedance ground field consisting of several "made ground" rods and/or extensive underground piping systems. Flat strap is preferred because it has less inductance per foot than round wire. *All* building ground connections should be made at a *single* point, and all grounded conductors connected to that point in a *star* configuration. A "ground window" should be established for *all* wiring entering the radio room. This is a single bulkhead plate where all ground connections are commoned, and where all suppressors are connected. This ground window is then connected to the master system single point ground by heavy strap in the same manner as the mast ground. *No* alternate ground paths should be allowed through the radio equipment. Power, telco, network, antenna, etc cabling must *all* pass through the ground window and be either grounded there or properly suppressed there. This prevents ground loops *through* the equipment.

Proper suppressors are a must. PolyPhaser (800-325-7170), and others, make suitable suppressors for all types of wiring. (I mention PolyPhaser by name only because I use their products, and they have proved effective. I'm not in any way connected with them.) Ask for their catalog, and buy the book _The "Grounds" for Lightning and EMP Protection_ by Roger Block. That will explain in detail most of the techniques I've mentioned.

While a minimum Code installation *may* be sufficient *most* of the time, and many hams get away with such an installation for years, it won't be sufficient the one time you do take a direct strike. Proper installations aren't cheap or easy, but neither are structures or people. Do it right the first time.

You, sir, are a xenophobe with a shaky grasp of reality.

Modern Japanese radio equipment, with the possible exception of Kenwood,
is of high quality construction and sophisticated design. Most TenTec
equipment is by comparison crude, though with workmanlike performance.
One reason people brag about TenTec service is because they *need*
TenTec service. Most Japanese equipment doesn't break during the life
of the product. This is mostly due to more automated assembly/testing,
and better internal cabling systems.

TenTec is about the best *American made* amateur equipment still on
the market since Drake and Collins left the field, but it's not the
best amateur equipment made. That honor belongs to the Japanese.
Commercial grade American made equipment is still at least as good,
if not better, than commercial grade Japanese equipment, but the
same can't be said of amateur grade equipment.

TenTec equipment does have one feature not shared by Japanese equipment.
It is of open, hand assembled construction. That makes for easier home
modification and servicing by unsophisticated users since there is very
little high density surface mount circuitry. People who understand the
techniques required, however, find that such circuitry is no more difficult,
actually easier, to service than the older TenTec style of construction.

Hello all you expercts in Internet land. I recently bought a FT2400
Yaesu 2 meter rig. Its very good but have scrambled the memory
by not hooking it up directly to the battery of the car. I thought
I fixed the problem and also added a Radio Shack 20 Amp noise eliminator.
Well...got a little careless when I disconnected the battery accidently
leaving the rig on. On reconnecting again the set looks like its gone.. cant turn off
display scrambled etc...real scary. Managed to reboot it , lost all saved
repeaters etc. The real question is there any fix for this sensetivity? Can
I hook up a large cap across the rig line to absorb spikes or must I live with this... and
be careful?
Thanks for your replys and looking forward to a solution.

The RF Connection in Gaithersburg, MD, (301)-840-5477 (ask for Joel) has _12V_ relays, with N connectors which have 90 db isolation at 1Ghz (measured myself) for a price that I considered a bargain (can't remember if it was $40, or $90 sorry). They are RLC electronics model S-2886-10110-229375. I ahve no connection with these guys except I've been buying coax, connectors and srimping tools etc for years and go back every time.

The local zoning ordinances do not restrict antenna heights, because we
are far from major cities. However, there are electrical codes (of
course). I believe we use the NEC.

I've checked a copy of the NEC, and they seem to recommend grounding the
mast to the same ground used by the building's electrical system. I'll
probably need some whomping big copper wire to do this (is 4-gauge the
right size)?

As for hitting the power lines: the mast/tower can be shorter, and therefore
less likely to hit the wires, if they're mounted on top of the roof instead
of on the ground. Would a chimney mount work for this sort of antenna?
How does one mount a tower on a roof?

>--
The battery takes what it takes and no more comes out. The real
thing is the voltage at the end of the charging cycle and the max
current the charge will supply (if it supplies any more, the
NiCads will stew). NiCads put out about 1.25V each and on charge
rise to about 1.35V each. If the charger was 10.5V, you probably
have 8 NiCads in your battery pack. If you charge them with
a 12V charger, the NiCads will have 1.5V each on them at full
charge. Go get the proper charger.

Well Greg,
I have had one for several months and am very pleased with it. I have had
no problems and have had may complements on the audio. It has some
very nice features that make it work the cost at $299 so $229 is a real
bargan. If I needed a 2-Meter WT I would buy one.
Only one shortcomming--the battery doesn't last as long as I would like.
Get an extra one...

Well, it depends on what you mean.... For receiving, it works fine. It's no scanner, so don't expect to rapidly advance through the frequencies looking for activity (it's scans soooo slowly), but for listening to a specific frequency, it does just fine.

Now, if you're talking about transmitting out of band (I won't ask, you don't tell...), it doesn't do too well. Not that I've ever tried transmitting out of band <snort, chuckle, etc>, but it seems that the power goes down the further you go up in frequency, until it gets to the point that it says it's transmitting, but it's putting out a millionth of a milliwatt (or some such..)

If you wanted to transmit just above the ham band, I'm sure it'd do fine, but I'm not sure if it's really made for that, so I couldn't say if that may do some internal damage over time.

Those are my observations....

> 9 db at 900 MHz is not a large antenna.

My choice is between a 9 dB and an 18 dB antenna. Neither is very large compared to a TV antenna, so I'm hoping to do a relatively light and simple installation. Ideally, I'd like to do a roof mount rather than pouring cement for a tower.

> The RS mast is actually of rather robust construction. It's sufficient
> to support the type of antenna you envision, though it should be pinned
> rather than depending on the friction clamps supplied.

I was thinking of a roof tripod (also sold by Radio Shack), but don't know if it's strong enough. Opinions? (It turns out that a chimney mount is out; the chimney is too close to the power lines.)

> It must be guyed properly. An alternative would be Rohn 20G with
> a roof mount. It would still need to be guyed.

With that much of a lever arm, and the winds in this area, guying would be a must. How strong must the wires be? How does one protect against corrosion? How do you attach guy wires to a cedar shake roof without creating leaks?

> The mast needs to be mounted in such a way that it cannot
> possibly fall across the AC mains wiring.

If I put it in the right place on the roof, it will be too short to reach -- by about 30 feet -- even if it falls flat. And, of course, the guy wires would hold it back....

> The requirements of the National Electrical Code are only a
> *minimum* starting point. They are not sufficient to protect the
> equipment. The minimum requirement is a number 8 solid wire,
> *mechanically* bonded to the mast and run in a *straight* line to

I was planning to use at least #4 -- the kind used to ground breaker boxes (and to bond them to water pipes). I'd expect to use a ground clamp to attach it. Is this enough?

> A better ground is a 5 inch copper strap, mechanically bonded to the
> mast, run in a straight line, and mechanically attached to a low
> impedance ground field consisting of several "made ground" rods and/or
> extensive underground piping systems.

The grounding rod for the building's electrical system is near
where the antenna would be mounted. Would it be sufficient to tie
the antenna ground to the ground lead coming off the meter box?
Or would the ground need to be beefed up substantially? (I
suppose I can pound a few more rods in and attach them to the
first.)

> Flat strap is preferred because it has less inductance per foot
> than round wire.

Where can it be obtained?

> *All* building ground connections should be made at a *single*
> point, and all grounded conductors connected to that point in a
> *star* configuration.

Well, currently the water pipes are bonded to a subpanel, which
in turn is grounded to the meter box. Is this sufficient?

> A "ground window" should be established for *all* wiring entering
> the radio room. This is a single bulkhead plate where all ground
> connections are commoned, and where all suppressors are

Could this be done on the wall above the grounding rod?

> Proper suppressors are a must. PolyPhaser (800-325-7170), and others,
> make suitable suppressors for all types of wiring. (I mention PolyPhaser
> by name only because I use their products, and they have proved effective.
> I'm not in any way connected with them.)

The NEC seems to assume that if you use a coax downlead, the
cable itself will arc internally if you get a direct hit -- after which
MOVs or zeners will catch the residual surge. Correct?

Ne> in the 500-510 MHz range, after the keyboard mod is done to extend
Ne> frequency range. Also, once the mod is done can those freqs be stored
Ne> in memory - i.e is the keyboard mod is done only once or on each
Ne> powerup? TNX.

Yes, all frequencies can be stored in memory.

Here are the results I got when checking W2A sensitivity. As you'll
see, its performance at 500 MHz is mediocre (worse than 1
microvolt). The measurements were made using an HP-8640B signal
generator, at Aerotron's lab in Raleigh, by KA2FWC and KN4AQ. We
didn't have time to measure all we wanted or double-check some
questionable results. So here's what we got:

Frequency Band Sensitivity in microvolts
(MHz) for 12dB SINAD
108 VHF 30
144 VHF .19
146 VHF .125
180 VHF 100
(questionable reading at 180)
200 VHF 225
224 VHF 225
300 VHF 6.5
350 VHF 75
==========
350 UHF .65
400 UHF 1
420 UHF 1.4
440 UHF .2
450 UHF .2
460 UHF 1.25
470 UHF 1.75
500 UHF 1.5
550 UHF no signal
600 UHF no signal
650 UHF no signal
675 UHF no signal
700 UHF 3
800 UHF 1.25
850 UHF .3
900 UHF .21
950 UHF 1.25
990 UHF 3

1000 UHF 150
1100 UHF no signal

By the way, the "pushbutton mod" to turn on EXTENDED RECEIVE on the W-2A is:

-- Turn radio off.
-- Press and hold [♯] [B] [3].
-- While holding those buttons, turn radio on.

The radio will now display frequencies from 0 to 1300 MHz, though actual receive seems somewhat less than that, as shown in the sensitivity list. The radio does hear AM in the aircraft band pretty well.

A chimney mount likely wouldn't be strong enough anyway. A masonary
chimney is not strong in shear. The RS roof tripod will do as a base
for their push up mast. Make sure you bolt it to *rafters* and not
just decking. The bolts can pull out of decking. Use *long* lag
bolts, or drill holes and use carriage bolts all the way through the
rafters.

Ordinary 1/8 inch steel aircraft cable should be plenty strong.
I'll not comment on how to avoid roof leaks except to say to
use lots of roofing cement to seal the holes where the lag anchors
are screwed into the rafters.

You want to attach directly to the star connection of your ground field. That should be one central ground rod to which is bonded all your other ground rods, water pipes, power and telco grounds, etc. You don't want to give lightning any options but your ground field. Don't daisy chain onto an existing ground run. That will put induced surges back into the house. With 10,000 amps in the lightning surge, even a small inductance will raise the connection point to a high potential.

>> Flat strap is preferred because it has less inductance per foot
>> than round wire.
>
>Where can it be obtained?

Roofing supply houses carry it on long rolls. It's used to seal the valleys in composition roofs. It's called copper *flashing* in the roofing trade. You should bolt all connections using a large bronze spreading washer. If you must use a steel washer, to prevent corrosion tin the copper at the connection point with solder. You don't want to solder connections, the solder will melt during a strike, but it's OK to tin the surface of the copper.

>> *All* building ground connections should be made at a *single*
>> point, and all grounded conductors connected to that point in a
>> *star* configuration.
>
>Well, currently the water pipes are bonded to a subpanel, which
>in turn is grounded to the meter box. Is this sufficient?

No. Run a separate lead to the central point you choose for all your house grounds. Never daisy chain ground leads. Single point star grounding is the secret to controlling lightning. Any ground loop is fatal to your protection scheme.

>> A "ground window" should be established for *all* wiring entering
>> the radio room. This is a single bulkhead plate where all ground
>> connections are commoned, and where all suppressors are
>> connected.
>
>Could this be done on the wall above the grounding rod?

Yes. I normally do it right at the point where I'm going to bring
radio cabling into the radio room because I want to make sure that
all equipment power leads as well as signal leads are commoned at
the ground window. *Every* equipment wire that connects, however
indirectly, to ground or to the antenna lead in, should be either
grounded or suppressed at the ground window plate, and that plate
should then be grounded directly, with strap, to the central star
connection of your ground field. What that does is tie all possible
wiring connections to your equipment to a single common point. That
prevents any differences in potential between the wires from a lightning
surge. No potential difference, no damaging current flow through
the equipment. It's not necessary that the ground window be at
zero potential. That's impossible anyway because there will be
some inductance in the strap leading to the ground field central
point connection. What's important is that all cabling be suppressed
to the *same* potential. If the ground window plate floats to
100,000 volts during a strike, that's OK because *every* wire
will be at the *same* potential. No potential difference, no
current flow.

>> Proper suppressors are a must. PolyPhaser (800-325-7170), and others,
>> make suitable suppressors for all types of wiring. (I mention PolyPhaser
>> by name only because I use their products, and they have proved effective.

>
>The NEC seems to assume that if you use a coax downlead, the
>cable itself will arc internally if you get a direct hit -- after which
>MOVs or zeners will catch the residual surge. Correct?

The coax will arc over at a voltage of 4,000 or more between the
inner and outer conductors. MOVs and zeners are too slow to deal
with that 4,000 volt pulse. That's why you want properly designed
gas discharge units. For receive applications, they will clamp
the differential voltage to no more than 22 volts in about 2 nanoseconds.
PolyPhaser uses a special circuit using a isolation capacitor in
the inner conductor path. The charge time on that capacitor is
sufficient to allow the gas tube to fire before the voltage can
rise enough to put the spike into your equipment. That'll protect
your sensitive electronic equipment. Remember that the NEC is concerned
with electrical safety as it relates to people and structures. It's not
concerned about protecting delicate equipment from spikes that can
rupture silicon junctions.

Also don't forget the large common mode voltage that's going to
be on *both* coax conductors. You've got to tie that to the
common point to prevent it finding it's way through your equipment.
The suppressors will deal with that too if they are mounted directly
on the ground window plate.

>Howard K2PYY

I have two FT2400H rigs. One in a Toyota, the other in a Honda. I have
had BOTH rigs in and out of the cars at least twice. I have never had
any problems with memory loss. Note that BOTH rigs were initially
programmed inside in a "base" configuration using an Astron power supply.

I have noticed that when you initially connect the rig to the auto's battery
(via 14 guage wire directly to the battery) there is a good sized spark
when the Yaesu-supplied connectors are initially joined. I have never
disconnected these while the radio is powered. I believe the FT2400H
is probably the best 2-meter mobile rig available.

In article <Ct00oI.CFz@hpcvsnz.cv.hp.com> davidc@lsid.hp.com (David Cook) writes:
>
>I am interested in either purchasing or assembling some kind of solar panel to
>be part of a charging system for 12 volt gel-cell batteries.
>

This is a common practice. There are several companies that make such
panels and chargers for 12v batteries. When setup with a regulator
circuit, these can keep 12v batteries charged very nicely.

A panel 30" X 30" will generate 14v at 2 amps in bright sunlight
using fairly reasonably priced solar cells (about $200 or so at hamfests
that I've seen, as I recall)

I'd buy these at a major hamfest, there are always a few vendors of
these at them. (I saw two or three at Dayton this year) Out in CA
and the southwest, where solar items are very common due to the many
days of bright sunlight, I'll bet they are more common.)

You do see these surplus now, but you'd better know enought to know
what you want....

Other sources: Check Nuts and Volts magazine. Lots of ad's there.
Also, the RV industry uses these to keep RV batteries chanrged. Try
a large RV store, or try and locate a specialty house (look at
a major RV magazine or product directory)

Up here in Cleveland, we don't really have enought sunny days for
solar cells to be a good choice. We tried solar last year for a
low power station on field day, and the weather did not cooperate.
(Columbus, 120 mi to the south of us, gets 31 days more sun than
we do. That's the price of living near the Great Lakes: lake effect.)

>I need a 6ft. long piece of 50 ohm low loss (like Belden 9913) coax with
>a female N connector on one end, and a mail N connector on the other. I
>can not build quality N connector connections by myself...

That's odd. I've bought N type patch cables from a couple of ham
stores (North Oldstead Amateur Radio Depot and AES, both in Cleveland)
at lower cost, too. I'd call and ask AES and HRO if you want new.

You could also try a few supply/surplus houses. I routinely see N
jumpers at hamfests, usually surplus, at very reasonable costs. Just saw
a couple at the Wellington Ohio hamfest yesterday (not your large hamfest,
either...)

Some one who does a lot of milatary radio surplus sales would be
a good choice. Fair Radio in Lima OH comes to mind, but may not be
the best for you.

2916. Tempo 2002 HELP!!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-17 14:18:23 UTC
From: Dave Quick <dquick@maroon.tc.umn.edu>
Message-ID: <47169.dquick@maroon.tc.umn.edu>
Source record: 225585
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.equipment

Help!

I recently purchased a used Tempo (Henry) 2002 2 meter kilowatt amplifier.
(Uses a pair of 8874 tubes in push-pull)

The amp was custom built by Henry to operate on 194 MHz. It was used in an
MRI lab. I'd like to move the amp back down to 144 MHz.

I have the only technical manaul available, which covers the 2002, 2006,
and 6N2. It has a schematic diagram of the amp, but does not provide the
dimensions of the tank coil, (a "U" shaped section of 3/4" tubing)
or any picture of the input circuitry. Also, the schematic is just plain
wrong in many areas. I called Henry about this, and they said there was
nothing they could do, and the don't have parts to sell me, and they
won't work on the amp because it's not their current model!

Does anyone out there have a Tempo 2002, or have experience
servicing one?

Thanks;

Dave Quick WD0EKL

For Sale:

Yaesu FT-101ZD Transceiver - $450.00

This was Yaesu's top-of-the-line rig in 1981. Except for two
small scratches on the top of the cabinet, it is in like-new
condition mechanically and electrically.

* Covers 160, 80, 40, 30, 20, 17, 15, 12, and 10 meters in three
ranges.

* SSB, CW: 180 watts input * Built in AC Supply
AM: 50 watts input

* Digital AND Analog Displays * Cooling Fan Option

* Continuously variable IF bandwidth (300Hz - 2.4 kHz)

* Noise blanker with threshold adjustment

* RF Speech processor

* VOX * Semi-break-in CW with sidetone * Selectable AGC

* 25 kHz crystal calibrator * Selectable attenuation

* All solid state except for 12BY7A driver and 2- 6146B finals

* Original manual and shipping carton

* Handheld microphone (not Yaesu)

* Built in speaker

This is really an outstanding rig for the seasoned amateur.

Call Jeff (Near Detroit)

: (Please reply via e-mail as I never read these newsgroups).

Sadly to say, the only major difference is that they don't come with
transmitters. :-)

The biggest difference I can see is that ham transceivers have filtering to
prevent out of band transmission (while transmitting in band) and that lowers
sensitivity out of ham bands.

Call me a bit absent minded if you must, but just how many rigs need a linear to get near this figure? If memory serves me right, most of the HF rigs I've seen will put out 100w or better.... and there's one in my shack that'll do 200w by itself.

So am I just remembering the high power rigs, and conveniently forgetting the lower power radios? Or is this a request to kick up a CB "just a tad"?

Jus' wonderin', what sort of radio do you want to use to drive the linear, and just how much drive can it supply?

Many years ago, I had a solid state linear that put out about 200w, and only needed about 5-6watts to drive.... It was "kinda noisy", and was typically sold in the _underground_ CB shops for mobile use.... Oh yeah, it would work at 10 meters also... But then, the early seventies were a lot different than today...

> AT&T Global Information Solutions

Greg,

The price change is for the HTX-404 440 MHz HT, it was $299 but RS cut the price until (I think) the end of July. Works well, I got both and they do the job for local stuff. The HTX-202 is still $259 but still a good deal since they really pack a lot in that box, and you get a Ni-Cd pack and AA battery case too with the rig. I use mine mobile and it works fine for the local repeaters/local simplex.
Regarding back-packing, I'd guess the HTX-202 would work well for what you're trying to do, just pack a few extra sets of AA batteries.
Have fun,
Joe KI3B

>--
>herbr@netcom.com

First check out a local hamfest. Many of the coax connector dealers which have been showing up in this area have been selling a threaded barrel connector, with nuts allowing you to put it through a 5/8 inch hole. Once you have the connectors, get a piece of aluminum, heavy cake pan will do, and drill to mount the connectors.

You're done.

If the dealers have not thought to bring this connector with them, try various vendors in QST, CQ, or 73 magazine.

Source record: 225604

My FT-470 has the dreaded loose BNC disease. I've previously repaired the connection at the BNC center post. This time, the pin between the lower PC board and the BNC has loosened at the board end.

It looks to me as though the board must be removed and the pin soldered from the backside. I'm wondering whether I want to tackle this task or let the Yaesu techs do it.

Advice on the ease of removal of the entire guts from the rear half of the case (are the PA's bolted to the case, well-siliconed, ...?) as well as alternative methods to reconnect the antenna feed will be greatly appreciated.

>Jason

Jason...

Since no 'Jason Wolter' currently shows up in the callsign server where
I looked, you might want to pass along your callsign, to assure potential
respondents that you're a licensed amateur looking to use said device
on the 10m band, versus a potential ab-user of the 11-meter band.

Some hams might be a bit uncomfortable answering a query for such an
amplifier until they have an idea of who's asking.

Source record: 225611

I'm looking into 2-m HT's. Aside from 'normal' ham activities, the rig will be my air-mobile station while flying hang gliders. Important considerations for this application include:
1) availability of earphone/mic PTT setup, and possibility of re-wiring this setup;
2) necessary mod to allow Rx and (in case of emergency) Tx up to 151.995 MHz;
3) possibility of Rx mod reaching weather freqs (?162 MHZ, right?) and/or aviation freqs (~110-130 MHz AM);

One recommended to me was the Alnico DJ-180 with 5-watt-capable batteries. However, I can find no info on the mod procedure for this at either oak.oakland nor at ftp.cs.buffalo.edu. Is this rig out-of-band modifiable?

While drooling over a HRO catalogue, it seems the F1T does offer the desired Rx. Might this be a better choice? (and I DID find the mod sheet for this rig via ftp).

Interested in any comments people may have on either of these HT's, or others similarly suitable. E-mail or post here. Thanks!

Hi Steve;

To show you how popular the band is out here in California, LA has NO
440 channels left for repeaters. Sacramento (20 miles from me) is also
full. I'm suprised that Columbus isn't packed as well. There just ins't
as much activity on 440 as there is on 2-meters (we call it the CB band
out here). But that is what is good about it. You can even put up your
own repeater. Most of the 440 repeaters out here are listed as "closed",
but you can usually listen for a while, then hop on and ask some questions
about the repeater. Most the owners are very friendly, and won't care if
you use it. Just ask. The worse thing they can do is say "no".

To put up your own repeater, I'd recommend getting a Motorola Micor mobile.
They can be had for as little as $10 (or as much as $100). Very easy to
convert into a repeater. If you can't afford a duplexer, just run two
antennas (one for the tx, one for the rx). After it is up a while, people
will start popping on, and you'll make friends and supporters in no time.
I did that here in Sacramento. The hardest part is getting a site for the
repeater. It can be done at no cost, but will take some ingenuity.

========================================================================
================= Questions ================
========================================================================

1. What is this posting for? How shall it be used?

2. What mobile radio(s) are recomended for someone interested in both
mobile VHF communications and (non-mobile) packet radio. Is it better
to buy new or used?

3. What mobile radio has the most features (i.e. the feature you personally
consider valuable) for the price? (i.e. the benefit/cost ratio, with cost
being the variable to minimize.)

4. Given a price range of 50-500 dollars what new/(used in working condition)
mobile radios do you like, or would you recomend getting?

========================================================================
================= Answers ================
========================================================================

1. Q: What is this posting for? How shall it be used?
=====================================================

for?
====

This posting is intended for people who are interested in
getting started in both VHF packet radio and mobile VHF radio.
```

It is intended to help those people out who are operating
on a reduced budget and would like to get started for a
minimum cost.

This is a "work in progress" posting to the Usenet newsgroup
rec.radio.amateur.equipment. It is based on the observations
of readers of this group. It is intended that once this posting has matured
that it will be included as part of the FAQ for this group.

Disclaimer:
This posting is provided 'as is'.
No warranty whatsoever is expressed or implied,
in particular, no warranty that the information contained herein
is correct or useful in any way, although both is intended.

used?
=====

If you are new to packet radio like myself, read this posting
to find out what others (more experienced) amateurs think about
this subject.

If you are an experienced amateur, email me (Kent Jones, KC7BCU at
kjones@eecs.wsu.edu) with your ideas/current practices/flames and I will
attempt to include your ideas in this summary.

==========
2. Q: A) What mobile radio(s) are recomended for someone interested in both
mobile VHF communications and (non-mobile) packet radio?

B) Is it better to buy a radio new or used?
==========

A) What mobile radio(s) are recomended for someone interested in both
mobile VHF communications and (non-mobile) packet radio?

There are so many new and used rigs around, but not many used ones for sale,
so ask some local hams who have experience doing what you want to do.

Some radios that readers of this group use are:

o Alinco DR570 in the car (would like more memories in this)
o Icom IC24AT HT that can be hooked up at home
o Kenwood TS-700 multi-mode 2m at home (wants repeater offsets in 145 band)

B) Is it better to buy a radio new or used?

First of all what do you want in a radio?

Do you want output power, memeories, 9600 baud packet, small size,
built in duplexer or two output tails?

Are you concerned more about cost or functionality?

Reasons for buying new
----
a) You can't find what you need used.
b) You don't want to mess with fixing a broken radio.

Reasons given for buying used
----
a) You need something cheap.
b) Your packet terminal can't tell whether it's connected to the local S9
packet node via the $100 25 year old hamfest special, with thumbwheel
switches and a mechanical T/R relay or via a new $1000 Blue Streak Turbo
Packet Banger deluxe.

==========
3. Q: What mobile radio has the most features (i.e. the feature you personally
consider valuable) for the price. (i.e. the benefit/cost ratio, with cost
being the variable to minimize.)
==========

(Due to my email problems there is no info available for this question yet)

==========
4. Q: Given a price range of 50-500 dollars what new/(used in working condition)
mobile radios do you like, or would you recomend getting?
==========

(Due to my email problems there is no info available for this question yet)

I've also gone the chisel route with my Icom BP-84 packs. I used
a sharp chisel and smacked it with the heel of my hand instead of
a hammer. On the Icom packs, you have to break loose a panel
on the bottom of the pack for access. Two common 3-cell ni-cad
AA cordless telephone packs from Radio Shack fit nicely with
slightly less capacity than the originals (but more than the dead
pack :-)). Back on the air for less than $20.00!

2941. Re: SUMMARY DSP algorithms

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-18 17:52:52 UTC
From: dbraun@ilx049.iil.intel.com
Message-ID: <30efhkINN3ij7@ilx018.iil.intel.com>
Source record: 225614

I recently got a truly righteous PC ,with a Pentium-60 and
a 16-bit Soundblaster. I realized that this hardware ought to
perform at least as well as the DSP chips in things like the W9GR
DSP box.

So, has anyone seen software (free) to do autio filtering and NR
that will run on PC's with the Soundblaster? If not, I will probably
write my own. Are there any examples of high-level code for
things like notch filtering and noise reduction? All I've found
is code written in assembler for DSP chips, and it's very hard to
deduce the algorithms from them. Bandpass FIR filters I already
understand.

Also, are there any FAX/SSTV programs out there that use the Soundblaster?
Things like Hamcomm are nice, but they would be much nicer if they
worked with the soundblaster as well as the custom hardware they
currently need.

Thanks,

Doug Braun (4X/N1OWU)

My source guessed low power. The whole business sounds odd to me, but
the new issue of RS's Radio devotes a lot of space to the amateur radio
service, at least in comparison to their current equipment offerings.

: of price? Any rumors in that area? Seems like it could only be something like
: a TEN-TEC Scout only low power (and quality???).

I agree Dave, They had the little 10M rig and I believe it cost about
$300 when it first came out! The Ten*Tec Argo costs $499 and it's only
one band (at a time). I thinks Jerry's friends are pulling his leg.
I'd LOVE to see RS come out with a 6 (or 2) Meter version of the HTX-100
(or whatever it was called) for the same price.

Handhelds aside, it's possible to buy a used 2m mobile with the above features-- I sold one myself a couple of years ago for I think $150 or $175 and last I heard, it's still doing OK (but Murphy's Law intervened after I sold the rig-- the PA went out on it. The ham I sold it to was resourceful and got a replacement part).

Check some of the larger ham shops around the country that have a used gear department or scour the classifieds. A gem may show up.

2947. ICOM V21 Rx Expansion

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-18 19:22:32 UTC
From: jjm@mark4sun.jpl.nasa.gov
Message-ID: <jjm.1124946992A@kea.jpl.nasa.gov>
Source record: 225620

Does the keyboard sequence for expanding the receive on the Icom W21AT (2m/440) also work on the V21AT (2m/220)? What effect does this have on the HT's performance, e.g., more intermod problems? How do you undo this mod? Will the complete reset undo it? Will the partial reset (which doesn't affect all the memory channels) undo it?

Thanks.
KE6IGX

>system is not entitled to ANY protection from interference from any other
>source.

Fortunately, the antennas which will be pointed at this one will all be
directional (about 6 degrees, and less than a mile away). To what extent
will licensed transmissions be a problem?

>D) A true 9 dB omnidirectional antenna (PD1110) is 13.2 feet long with 1.7
>sq ft of windload area, not a terribly small device. Be sure that your
>antenna support structure can handle that during peak winds of up to 100
>mph.

Will need to get ratings on this.

>How often do you get icing on antennas on your building? Windload
>with 1/2" radial ice goes up to 2.4 sq ft and a bending moment of 464
>ft-lb, much more than the RS mast can handle.

The building has no antennas at present. There are occasional ice storms,
though, so I'm planning on having to deal with some icing. Where can I

find the formulae to calculate bending moments, etc.?

>If any of these points are beyond your capabilities, call a professional
>radio service and/or a professional tower installation company for
>assistance. The slight extra cost to do things right may be quite
>worthwhile in the long run.

May have to consult one. I have the math and physics but not the hard-won
practical experience (and I don't care to win it)....

Look at the new Kenwood TH-79A also. It's got a new
alphanumeric display that let's you display names or
locations rather than just frequencies in your
memories. Also, it's got a built-in menu system to
make it easier to use. Not cheap, though. List is
$599; figure street price at arount $490.

It's now $549.00.

The TenTec Scout is a good rig, but it is designed as only a ham would
design it. It is basicly a simple rig without a synthesiser. It uses a
PTO and computer controlled variactors to correct drift. This
system works well and has no sythesiser noise.

It does require extensive programming when you consider the microprocessor
also emulates a curtis keyer too.

TenTec equipment is also designed to be easy to fix by people who do
not understand surface mount electronics and complex digital logic.

The down side of the Scout is it is relatively expansive to make, especially
with "highly paid" american labor. Any radio shack rig would be made in
Korea by "low paid" machines.

Another important point is profit margin. Radio Shack can buy parts cheaper,
and spread development costs out over a much larger product run.

Radio Shack already sells a whole line of hf (11m) rigs under
$150, with ssb, digital signal processing, base station power supplies, etc.
Many of these radios are under $100. A simple 80m (3.5-4Mhz) ssb/cw rig could
be extended to 2x (40m), 3x (30m), 4x (20m), 6x(15m), 8x (10m).

The only tricky part is to get lsb on 80m,40m and usb on 20m up.

5 watts out cw/ 25 watts pep ssb would be fine.

73,

Geoff.

I know this response is late
I just was 'lent' one of those Maxon radios, I took off the back and
found crystals! Looks like you will need to get some crystals (one for
transmit and one for receive) in the 2m band in order to use the radio.
Let me know if you found out anything about this like:
Price of batteries, crystals, etc.

Ne> yaesu ft530 are excellent for handling intermod. Would appreciate any
Ne> input. BTW, was quoted a price of $429 for a new Icom w2a...decent
Ne> price? 73
Ne> Joe Keenan

Hi, Joe. I have a W2A, and some friends have Yaesu 530's. Both radios hear some intermod in the higher RF areas here around Raleigh, NC, especially when connected to higher gain base or mobile antennas. With the "rubber ducks" its not so bad, but I wouldn't call either radio "excellent for handling intermod." I don't know of any dual-band HT that fits that description, though.

Maybe you can borrow one for a few days and see what its like at your location.

$429 is in the ballpark. Icom just discontinued the W2A, so there'll probably be a few closeout sales before they're gone. Maybe I ought to pick myself up another one -- I do like mine.

2959. Carrier-current antenna alternative

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-19 07:39:54 UTC
From: rbe3@konichiwa.cc.columbia.edu
Message-ID: <30g00a$5hp@apakabar.cc.columbia.edu>
Source record: 225633

I built a Ramsey FM10a and it does work really well. The only problem seems to be with the propogation through a seventeen story steel and concrete building which my radio station is trying to reach. I have a standard dipole oriented with the signal lobes going vertically. I've considered a ground plane but that does not seem appropriate for vertical coverage.

The Ramsey manual mentions something called "carrier-current" but tactifully evades saying anything more on it. Essentially it is an antenna alternative which allows the signal to be broadcast through a building's power outlets via internal wiring. I have not been able to find any information on this topic in any ARRL book or maazines or anywhere!

If anyone knows how to set up a "carrier-current" antenna configuration or knows where any information on this topic can be found, I would be greatly appreciative. Either post on this group or email rbe3@columbia.edu with any information. Thanks!

I don't have the same problem but when I opened up my ft-530 to replace a blown output stage, I remember seeing a whole bunch of adj. pots. Remove the battery, then four tiny screws that hold the bottom contact plate (cover), and they're all there ... I don't remember if they are labelled or if the adjustments you require are in that location but it's easy to get to. Good luck. Denis.

I have seen these threaded barrel connectors (from a few to several inches long) at a place called "RA-Elco Electronics" in Salt Lake City, Utah (801-487-7749 or 801-487-0571). I have never seen the likes of them anywhere else (long barrel connectors that is...), but they look like they would do just the job. If you can't locate them anywhere else, the phone call would be less trouble. They might be able to tell you who makes them, or if they'll do, send them to you just the same. They aren't a mail order company, but just a small store that is looked upon as having "it" when almost no else does. They provide a great service to teh hams here in the area.

I believe that this claim is also an overstatement of reality. I find
that there is a great deal of variability in quality among the Japanese
manufacturers (and indeed among product lines of individual
manufacturers).

If you go shopping with the mind set of "Japanese=quality", you deserve
what you get. Caveat Emptor

Yup, it is rather fun to follow the progress of such rumors. A 10-80m HF
rig for $250-300 is pushing the envelope perhaps, but not technically
impossible, even for a CW/SSB unit. After all, look at what MFJ has done.
I would doubt, however, that this alleged unit runs more than 5 watts.
But that's OK too. QRP is loads of fun, and a lot easier to work than
most people think. The Radio Shack catalog is due out next month, and
often shows products that won't be available until winter. So we'll see.
Actually, it's a rather poor time to introduce an HF rig, what with the
sun spot cycle...

2971. Motorola Micor

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-19 15:56:14 UTC
From: boutell@pogo.den.mmc.com
Message-ID: <1994Jul19.155614.17445@news2.den.mmc.com>
Source record: 225645

Hello all.

I'm looking for info on converting the Motorola Micor into a
2 Meter repeater. So here are a few questions:

1) Has anyone seen a mod description from an ftp source?

2) If anyone has a copy of the mods, would you mind e-mailing
them to me please?

3) I'm trying to go cheap by using dual antennas instead of a
duplexor. Would 25-30 feet separation of antenna's be enough?

4) Does anyone have a working Micor they would like to sell me
for somewhere in the $50.00 range???

5) What is a good source for repeater parts such as autopatch, etc?

Thanks in advance for your help.

More than 1-1/2 years ago, a close friend *paid* for an Atlas 310 when
it was still on the drawing board stage...to help "ATLAS RADIO" get
the financing needed to start up their production line.

Here is what George reports on the *performance* of the 310:

"I still have not received the radio!"

As far as my friend knows, this radio exists only as a photo in an
ad on page 66 of the August 1994 issue of CQ radio.

You'll like this even better: Install a dryer vent. yep...it's 4-5" in
diameter, you can run many cables thru it and still have room for more. I
solved the problem of insect-invasion by stuffing a rag in the vent from
the outside and spraying it with RAID. Cheers!

I thought I'd post this for everyone. Yaesu maintains copies of their
manuals, and you can purchase a copy for a minimal amount. I don't have
the info here, but call the phone number posted in one of the magazines and
ask for technical support. In my case, they mailed the manual to me and sent
the invoice with it...I think it was 6 or 7 bucks. I got it within 3 or 4
days.....I'd
call that good service.

I don't remember where I first read this, and I didn't do the analysis, but
someone reported that if the price of amateur radio equipment had fallen
like color TV prices.....well, we wouldn't be paying $1500 for a Kenwood
TS450 (or similar radio). Of course, the volume of color TV sales is
countlessly greater than amateur radio transceivers.
Again....if EVERY home had an amateur radio transceiver??? AARRGGGHHH!!!!

Hello all- A friend and I are delving into our 742/942's and find that there are two special modules (front ends) for 800mhz and 400mhz. The 800mhz one comes out to an un-soldered pad on the board, and IS selected when you activate 800mhz- but it is not fed a signal. Thus, 800 mhz RX is deaf. Has anyone delved into this and brewed up a mod? I think the 1200 setion also is 800 capable..Ill check tonite. Thanks!

2982. Timewave DSP Filter & Teletype Decoders?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-19 22:19:49 UTC
From: mikec@praxis.co.uk
Message-ID: <MIKEC.94Jul19231949@leibniz.praxis.co.uk>
Source record: 225511
Cross-posted to: rec.radio.amateur.equipment,rec.radio.shortwave

Hi All,

Anyone using a Timewave DSP Filter with something like a Hoka decoder? I'm considering one for my system - Drake R8 and Hoka Code 3. I've had a chance to try the JPS DSP's but I didn't find them as great an improvement as I might have expected. The W9GR was a bit better but still not a great deal better than the benchmark - the old (analogue) Datong FL3.

Now, all of these DSP filters appeared to lack something - none of them have a line audio output, something that's quite useful if you have a decoder!

BUT - I noticed that the Timewave DSP9-plus has a line output but the nearest stockist is some way away from me and I'll be unable to "test-drive" one. So, anyone got one of these beasts? Does it work OK ? Do you use it for decoding work? I've heard reports that these machines radiate! (They're built in a plastic box) - Is this true?, it'd be daft if it was :-)

Thanks & 73, Mike

Yes you can tune it to the Ham bands. You can get the Cristals from
Maxon or from JAN.
I have one CP-0150 with drop-in desk charger and CTCSS tone code Like
new in the box for $130 shipped if you know anyone else that would like
one. I have one freq. on 154.600. I did have 146.700rx 146.100tx
cristals in it about 3 mounths ago but don't care to use it here in RI
because of the new CB band.

2989. GPS for RF environments

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-20 02:18:06 UTC
From: hlivak@wintermute.tmc.edu
Message-ID: <Ct7vq7.5qE@news.Hawaii.Edu>
Source record: 225513

I am considering the purchase of a portable GPS unit and wanted to seek advice from people involved in radio. The unit will be used to support field surveys of radio sites and will need to perform well in high RF field environments. Also it is important to get a unit that will do a good job in determining elevation. And considering I'll be using it in the field, it had better be rugged, hi.

I'm a GPS neophyte and also need ponters as to any other capabilities or features I should look for or avoid. Which datum sets are the most commonly used or preferred?

If you can point me to an on-line FAQ that'd also be appreciated. Finally if you have a mail order vendor where I can get it better, faster, and cheaper, let me know.

Regards, Bob NH6XO

I don't have the same problem but when I opened up my ft-530 to replace a blown output stage, I remember seeing a whole bunch of adj. pots. Remove the battery, then four tiny screws that hold the bottom contact plate (cover), and they're all there ... I don't remember if they are labelled or if the adjustments you require are in that location but it's easy to get to. Good luck. Denis.

Ne> price? 73
Ne> Joe Keenan

Hi, Joe. I have a W2A, and some friends have Yaesu 530's. Both radios
hear some intermod in the higher RF areas here around Raleigh, NC,
especially when connected to higher gain base or mobile antennas. With
the "rubber ducks" its not so bad, but I wouldn't call either radio
"excellent for handling intermod." I don't know of any dual-band
HT that fits that description, though.

Maybe you can borrow one for a few days and see what its like at your
location.

$429 is in the ballpark. Icom just discontinued the W2A, so there'll
probably be a few closeout sales before they're gone. Maybe I ought to
pick myself up another one -- I do like mine.

More than 1-1/2 years ago, a close friend *paid* for an Atlas 310 when
it was still on the drawing board stage...to help "ATLAS RADIO" get
the financing needed to start up their production line.

Here is what George reports on the *performance* of the 310:

"I still have not received the radio!"

As far as my friend knows, this radio exists only as a photo in an
ad on page 66 of the August 1994 issue of CQ radio.

To: ham-equip@ucsd.edu

I have seen these threaded barrel connectors (from a few to several inches long)
at a place called "RA-Elco Electronics" in Salt Lake City, Utah (801-487-7749 or
801-487-0571). I have never seen the likes of them anywhere else (long barrel
connectors that is...), but they look like they would do just the job. If you
can't locate them anywhere else, the phone call would be less trouble. They
might be able to tell you who makes them, or if they'll do, send them to you
just the same. They aren't a mail order company, but just a small store that
is looked upon as having "it" when almost no else does. They provide a great
service to teh hams here in the area.

You'll like this even better: Install a dryer vent. yep...it's 4-5" in
diameter, you can run many cables thru it and still have room for more. I
solved the problem of insect-invasion by stuffing a rag in the vent from
the outside and spraying it with RAID. Cheers!

Subject: Looking for Handheld Personal Radio Transceiver
To: ham-equip@ucsd.edu

Adam Leech (No.E-Mail.Available) wrote:
: I'm currently on the market for a wlakie-talkie type transceiver, and
: was wondering if any of you had any suggestions. My target price range
: is less than $1000 for a pair(or less than $500 for one). My main
: concerns are range, sound clarity, and size. Thanks.

Radio Shack has some nice (heh heh :) walkie-talkie type transcievers, and
they should meet your budget. They have 49 MHz walkie talkies for under
$100 a pair. What a deal!!!!!! CB's might also work.

Ya know, I kind of wonder why nobody responded to you!!! ;)

Subject: Motorola Micor
To: ham-equip@ucsd.edu

Hello all.

I'm looking for info on converting the Motorola Micor into a
2 Meter repeater. So here are a few questions:

1) Has anyone seen a mod description from an ftp source?

2) If anyone has a copy of the mods, would you mind e-mailing
them to me please?

3) I'm trying to go cheap by using dual antennas instead of a
duplexor. Would 25-30 feet separation of antenna's be enough?

4) Does anyone have a working Micor they would like to sell me
for somewhere in the $50.00 range???

5) What is a good source for repeater parts such as autopatch, etc?

Thanks in advance for your help.

I believe that this claim is also an overstatement of reality. I find
that there is a great deal of variability in quality among the Japanese
manufacturers (and indeed among product lines of individual
manufacturers).

If you go shopping with the mind set of "Japanese=quality", you deserve
what you get. Caveat Emptor

Subject: TM942a +800mhz ???
To: ham-equip@ucsd.edu

Hello all- A friend and I are delving into our 742/942's and find that
there are two special modules (front ends) for 800mhz and 400mhz.
The 800mhz one comes out to an un-soldered pad on the board, and IS
selected when you activate 800mhz- but it is not fed a signal. Thus, 800
mhz RX is deaf. Has anyone delved into this and brewed up a mod?
I think the 1200 setion also is 800 capable..Ill check tonite.
Thanks!

Yup, it is rather fun to follow the progress of such rumors. A 10-80m HF
rig for $250-300 is pushing the envelope perhaps, but not technically
impossible, even for a CW/SSB unit. After all, look at what MFJ has done.
I would doubt, however, that this alleged unit runs more than 5 watts.
But that's OK too. QRP is loads of fun, and a lot easier to work than
most people think. The Radio Shack catalog is due out next month, and
often shows products that won't be available until winter. So we'll see.
Actually, it's a rather poor time to introduce an HF rig, what with the
sun spot cycle...

The Drake users and Swap Net does indeed get on the air starting at 8PM EST on 3865kc. Net controls vary from week to week, and may be as far west as Western Ohio or as far east as, well, H20.

This seems an *excellent* place to find gear; prices on TR4CWs with remote VFO and PS, ostensibly in excellent to mint condition were asking in the $300-400 range.

Might be a place to find a terrific old rig.

That's exactly how it's done at the ground rod. A commercial bronze grounding clamp, available at any electrical supply store, is what you use. This gives a NEC compliant ground connection for wire. If you are using strap, you have to be a bit more creative. Since the ground rod is copper clad, you can wrap the copper strap directly around the rod and clamp it in place with stainless steel hose clamps, available at automotive shops. Connecting to the mast or tower has to be done slightly differently. Because copper and galvanized steel react electrochemically, they can't be allowed to touch. You have to use a stainless steel intermediate clamp at the mast. This is a double clamp with one half clamping to the mast, and the other clamping to the copper ground lead. Polyphaser, and others, sell these to fit standard Rohn towers and masts.

You can also cadweld the copper to the ground rod, but I don't recomend that as an amateur practice. It's a bit tricky to get a good mechanical bond if you aren't experienced with using cadweld kits.

QRP will have little to do w/the price. A good receiver section will be the
most critical and costly section. $200-300? Maybe a single band unit mass
produced.

Whatever happened to the infrared PC Mouse by BSR they were supposed to have
2 years ago? They even advertised it, never sold one here in Maryland.

$200-300 will get you a RS crystal radio w/transmitter section.

Now, if they manufacture it in mainland China, that price may well be
'Realistic'.

Pricing is related to the quantity they expect to sell. For example,
compare pricing on an HT for 440 (or a higher band) with a cellular
phone. Will the volume be there? Who knows what Radio Shack marketeers
predict? Also, rumor prices are frequently much lower.

So what would ham gear cost if there was a multi-million unit market?
Two-meter HT's for $99.95 at Wal Mart? Blue light specials on 440
before the next contest?

In article <qo6NPc3w165w@earldom.sacbbx.com> jre@earldom.sacbbx.com (Jim Earl) writes:

To put up your own repeater, I'd recommend getting a Motorola Micor mobile.
They can be had for as little as $10 (or as much as $100). Very easy to
convert into a repeater. If you can't afford a duplexer, just run two
antennas (one for the tx, one for the rx). After it is up a while, people
will start popping on, and you'll make friends and supporters in no time.
I did that here in Sacramento. The hardest part is getting a site for the
repeater. It can be done at no cost, but will take some ingenuity.

This brings up a point I've been meaning to ask about for quite some time.
I've been a ham for years, and have heard many references to different
Motorola radio models and/or alphanumeric codes. Does anyone out there
have a cross-reference list, pointers to a FAQ, etc., which tell what
models cover what bands? More importantly, how do I decode the
alphanumeric codes to figure out what band a particular Motorola rig I
might run across at a hamfest covers?

Thanks es 73,

Jeff

I have a Ten Tec Century 21 CW transceiver that I want to sell
at a Hamfest in Springfield Missouri in early August.
How much should I ask for it? I bought it second hand about 10 or 15
years ago and really don't remember what I paid for it then. But it
works just fine and is still in good shape. It's a good novice radio.
Anyone familiar with this rig or anyone who has any idea of what it
might be worth please respond. Thanks very much in advance.

They have an "all-band" shortwave radio for $179. They could probably add a transmitter section for $100, coming in under the $300 mark total. (No, they won't (I hope!) take the DX-380 circuit as-is and add a transmitter, but it is probably a good start.)

3004. QRP RIGS

3006. Re: Ham-Equip Digest V94 #241

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-20 19:19:42 UTC
From: davev@miles.ATkc.COM
Message-ID: <9407201919.AA00453@miles.noname>
Source record: 225530

Two requests:

1) I have an Icom 720 A I use for 40 meter CW. The manual talks about the FL32 narrow notch filter as an accessory. Of course, Icom doesn't have any and hasn't since Bush was elected to the White House. Does anyone know how to get one, or an equivalent?

2) My wife passed her no code tech. I want to get her a 2M mobile. Here are the requirements:

a) cheap

b) easy to operate, real simple, little more than a CB

c) very reliable. This is her emergency radio

d) good audio, not necessarily great

e) Synthesized frequencies, CTSS, etc. modern

f) About a dozen memories for local repeaters

g) Good output power, maybe 25-50 watts.

h) Receiver relatively immune to auto interference.

i) Small - fits in the regular auto radio slot in the car.

j) cheap

I've got a HT-202. We think it's great. We're not really high class/option minded. Forget packet. Forget removable face plates. Forget fancy anything. I'd be looking for like $200-$225, used. This is going into a '82 Ford Fairmont. Keep that in perspective. What do y'all recommend?

3007. Comments on SGC's SG-2000 HF Radio?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-20 19:20:26 UTC
From: "Kenneth M. Gianino" <gianino@sbctri.sbc.com>
Message-ID: <30jtdq$1k5@sbctri.sbc.com>
Source record: 225531

Any SG-2000 users or owners out there that would like to post their pros and cons? I've used one (for a short time) at our local Red Cross chapter and it seems to be rugged and simple to use. Other than reading the specs, I don't have a good feel for how it's RF performance "stacks up" to other similarly priced radios. How about you ARRL insiders -any technical review planned? E-mail is fine, but I think there are others on the net that would be interested.
Ken - WB0QNA

Jim,

I have had the 300w tuner from MFJ for three+ years now, and have had nothing but fun with it. The tuner does exactly what it says that it will do...tune just about anything. You should have no trouble with the tuner.

73,

Bill, N9JLP

3009. Re: Alinco DR-1200T

> I'm thinking of picking up one of these mobile Alincos for data as well
> as voice. Any good/bad/whatever stories?

Don't buy it if you want voice use, the cost of a microphone and mobile mounting bracket is more than the difference in cost between a DR1200 and a DR119 (or whatever the current "voice" model is called). Meanwhile the "voice" model will include sub-audible tone encoder and DTMF pad on the mic, and 45W rather than 25W output. I hear the 1200's RF deck is the same as the 45W, with the drive level turned down.

Older DR1200's are infamous for burning out their LCD backlights. For packet, who cares? Actually I like the fact my radio no longer has a backlight and am thinking of opening my 9600 baud DR1200 and disconnecting 'em before they burn out.

Oh, and the DR1200TH (the "high speed" 9600 model) CAN NOT be used for voice because they wire the mic connector around the original mic circuits.

Newer radios from Icom and Yaesu offer "9600 ports" on the back of the radio and would be worth very serious consideration for the flexibility. I don't know if Alinco offers this feature yet.

3010. ICOM Handhelds for Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-20 20:55:51 UTC
From: lewiz@netcom.com
Message-ID: <lewizCt9BH3.7t7@netcom.com>
Source record: 225535

I have the following ICOM handheld radios for sale:

IC02AT - 2-meter synthesized, modified for out-of-band receive/transmit.

IC04AT - 440 handheld, modified for out-of-band capability.

IC3AT - 220 handheld, with PL unit installed.

IC3AT - 220 handheld, with -1.2 control channel split & PL installed.

In addition, I have a YAESU dual-band (144/440) mobile radio, 25 watts.
I believe it is model #2500 (been in my garage for 2 years). It is a
very compact design, and includes dual-band mobile antenna bi-plexer.

Interested parties may private email or call, 213-225-3694. Thanks!

Oh yes... almost forgot....

IC12AT - 1.2GHz handheld also for sale!

your comments/flames/suggestions at kjones@eecs.wsu.edu

I have attempted to acknowledge all contributors at the end
of the FAQ.

Currently the info is a little thin, but expect it to grow as you
contribute.

Kent Jones
kjones@eecs.wsu.edu

To find the answer of question number 'x', search for the string
"x. Q:" (so the answer to question 12 is at 12. Q:)

==========
========== Questions ==========
==========

1. What is this posting for? How shall it be used?

2. What mobile radio(s) are recommended for someone interested in both
mobile VHF communications and (non-mobile) packet radio. Is it better
to buy new or used?

3. What mobile radio has the most features (i.e. the feature you personally
consider valuable) for the price? (i.e. the benefit/cost ratio, with cost
being the variable to minimize.)

4. Given a price range of 50-500 dollars what new/(used in working condition)
mobile radios do you like, or would you recommend getting?

==========
========== Answers ==========
==========

==========
1. Q: A) What is this posting for?

B) How shall it be used?
==========

A) What is this posting for?

This posting is intended for people who are interested in
getting started in both VHF packet radio and mobile VHF radio.
It is intended to help those people out who are operating
on a reduced budget and would like to get started for a
minimum cost.

This is a "work in progress" posting to the Usenet newsgroup
rec.radio.amateur.equipment. It is based on the observations
of readers of this group. It is intended that once this posting has matured
that it will be included as part of the FAQ for this group.

Disclaimer:
This posting is provided 'as is'.
No warranty whatsoever is expressed or implied,
in particular, no warranty that the information contained herein
is correct or useful in any way, although both is intended.

B) How shall it be used?

If you are new to packet radio like myself, read this posting
to find out what others (more experienced) amateurs think about
this subject.

If you are an experienced amateur, email me (Kent Jones, KC7BCU at
kjones@eecs.wsu.edu) with your ideas/current practices/flames and I will
attempt to include your ideas in this summary.

==========
2. Q: A) What mobile radio(s) are recommended for someone interested in both
mobile VHF communications and (non-mobile) packet radio?

B) Is it better to buy a radio new or used?
==========

A) What mobile radio(s) are recommended for someone interested in both
mobile VHF communications and (non-mobile) packet radio?

Almost every mobile rig on the market is suitable for both mobile and
packet use. However, for packet use, you don't need all the bells and
whistles usually found on a late model mobile rig. You don't even need
frequency synthesis. A good crystal controlled rig with good thermal
design is all that's needed for packet.

One amateur made note of the fact that using a mobile rig for dual duty
gets old fast because you are constantly taking it in and out of the car.
He thought that most people end up buying one for the car and another
for packet at the house. The two applications are not very similar in
their requirements.

Some radios that readers of this group use (have used) are:

o IC28H (2 meter rig good for packet and/or mobile use)
o Alinco DR570 in the car (solid performer, needs more memories?)
o Icom IC24AT HT that can be hooked up at home
o Kenwood TS-700 multi-mode 2m at home (wants repeater offsets in 145 band)

B) Is it better to buy a radio new or used?

You may not want to suffer that new rig depreciation that strikes as you walk out of the showroom, so it may be better to buy a radio that's already taken that hit by getting one second hand. On the other hand, a late model radio that's already on the used market may be being sold because it's a dog, and of course will have no warranty. It takes a bit of experience to successfully buy in the used market, but if you have that experience, you'll almost always get more radio for your money. Also, there are a lot of different new and used rigs around, but not many used ones for sale, so ask some local hams who have experience doing what you want to do.

First of all what do you want in a radio?

Do you want output power, memories, 9600 baud packet, small size, built in duplexer or two output tails?

Are you concerned more about cost or functionality?

Reasons for buying new
---
a) You can't find what you need used.
b) You don't want to mess with fixing a broken radio.
c) You want something that has a warranty.

Reasons given for buying used
---
a) You need something cheap.
b) Your packet terminal can't tell whether it's connected to the local S9 packet node via the $100 25 year old hamfest special, with thumbwheel switches and a mechanical T/R relay or via a new $1000 Blue Streak Turbo Packet Banger deluxe.
c) You KNOW what you are doing and know you can fix the radio if it breaks or is broken when you buy it.

==========
3. Q: What mobile radio has the most features (i.e. the feature you personally consider valuable) for the price. (i.e. the benefit/cost ratio, with cost being the variable to minimize.)
==========

o Alinco 570

One contributor notes that he is partial to the Alinco 570. It has excellent thermal design, an adequate display, and a rather straight forward user interface. It's also a good value compared to other radios currently on the market.

==========
4. Q: Given a price range of 50-500 dollars what new/(working used) mobile radios do you like, or would you recommend getting?
==========

For Packet
----

o Micor
o GE Exec II

These two radios are still available for around $50-100 at most
hamfests. They are very rugged radios that can stand up to continuous
duty usage. They also have good intermod resistance and plenty of
output power.

For Mobile Use
----

o Alinco

Pick something a bit smaller and with better frequency agility.
Any of the Alinco rigs would do, as would most of the Icom and Yaesu
radios.

One amateur noted that there may be problems with the Kenwood
radios and their thermal design, susceptibility to intermod, and
arcane user interfaces. (He went on to note that Kenwood has generally
good HF equipment, but their VHF/UHF stuff seems to come from a
completely separate business unit. He said he had never owned or used
a Kenwood VHF/UHF radio that performed adequately for it's price class,
with the exception of an old TS700, and which he said had a lousy
receiver by modern standards.)

HI,

Can anyone help me at all?????

I have got hold of a Motorola MX360 UHF hand held wich is a 10 chnl synthersised rig. I also has a numberd jeypad on the front.
plus a sub minituer bush to make toggle switch...
I would like to convert this to the 70cm Ham band hand held, I know that it will need reprograming but I can't find any one who has got the soft ware to do this..... I have been told it could be " P " programing ???????? what ever that is.. even my friend who is a Motorola dealer cant get the software...

If anyone has a copy or can get me a copy it would be most appriciated...
If anyone knows of any where I could send it or you know and have the nessacery gear to convert it and are near BRIGHTON area let me know via this mediam..

If you can help you would make a poor man very very happy.... as it would mean that I havnet wasted 25 pounds on some old junk...

all the best

> plastic box) - Is this true?, it'd be daft if it was :-)

I have the DSP9+. See my comments above. Its main effect is to make the
background noise quieter though the difference is not always significant.
In data modes, only the bandwidth filtering operates and there is no
noise cancelling. Yes it has line output and is suited to data operation
from a connectivity point of view. As with other DSP filters, the setting
of the input audio level is critical to get maximum effect. The AGC
facility is of doubtful value as it just brings up the noise. On balance,
I find it poor value for money at UK prices (from my viewpoint). Lastly,
a DSP filter will NOT make an unreadable signal into a readable signal.

Jim Kerkhoff <kerkhoff@mail.utexas.edu> writes:

>Does anyone know of an index that covers the popular amateur radio rags?
>Is there one available on CD-ROM or by Internet?

Jim: There is a book in the reference department of your local library
called Ulrich's International Periodical Directory. You can call the library
and ask them to look up the entries for qst, 73, etc. If the magazine is
indexed in one of the standard indexes, such as reader's guide to periodical
literature, science index, whatever, the entry will mention that. Many
of these indexes are available on cd-rom at larger local libraries. The
cost of the cd-rom for home use would be quite prohibitive.

From: srhoades@netcom.com
Message-ID: <srhoadesCt9rFv.C8z@netcom.com>
Source record: 225543
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner

So here I was the other just sitting, minding my own business, when I discovered the following trick to receive 500-512+ Mhz on the FT-530.

On the UHF (right side) vfo, put 499.975 in the "L" memory.

Put 800.000 Mhz in the "U" memory.

Make sure that when in the Memory Recall mode, this channels are NOT set to be skipped.

Recall channel "L".

Press MR once. (Three little dashes should appear under the "L".

With the squelch closed, press the "UP" arrow key.

Happy scanning!

Most of the normal scanning functions will work. And, you can write the displayed freq. to any memory location.

Some purists might be saying, "just because it displays a certain freq. doesn't mean it actually receives it...". Granted, the sensitivity isn't the greatest but I can hear LAPD on 506 Mhz just fine.

I'd be curious to know just how far up you can go before the VFO unlocks.

Some of you 220 Mhz folks might be wondering if a similiar trick could be done on the VHF side vfo to receive 220 Mhz. Well, you can get the display to show 220 Mhz but I suspect the vfo is out of lock since the display blinks.

Btw, the radio I am doing this on has had the extended VFO mod done. I don't know if this makes a difference.

Now if I could only find a way to receive 40-54 Mhz....

Richard,

I just bought one with the calibrator and keyer for $195. Figuring that the keyer and calibrator are worth about $25 ea, you can figure about $125-150 for the rig. Since you're at a hamfest, I'd start at $175-200 and come down if you find someone really interested.

Simple (incomplete) guide:

```
U44MHT1100A
||||||+++++--- Features present on radio; varies by series.
|||||+-------- Power source
||||+--------- Transmitter series within radio model
|||+---------- Receiver series within model
||+----------- Band (1=25-50,2=66-88,3=136-174,4=420-512,5=800-950)
|+------------ Output power level (generally 1=<1W,2=2-5W,3=5-25W,4=25-40W,
| 5=40-70W,6=70-90W,7=90-120W; varies by band)
+------------- Mounting method (commonly U=universal,D=dash,T=trunk,H=handheld)
```

The power levels are from memory and are approximate. Note that the only
indication of frequency range within each band is in the feature code; you're
best off asking what frequency the radio is on, or looking at a channel
element, or maybe finding a stamped marking somewhere on the radio, before you
buy.

I HAPPILY purged my station of all "JAP JUNQUE" about
two and a half years ago when I ordered my TEN-TEC
OMNI VI. I have had a LOT of JAP stuff over the last
20 of my 33 years as a ham. (Actually I still have an
ICOM 211 - not working of course - that I am still trying
to unload).
I describe my JAP stuff using the "F.O.R.D." terminology
(Fix Or Repair Daily). I had the least troubles with Kenwood,
and the most with Icom. Yahoos were somewhere in between.
The TEN-TEC has been trouble free and a REAL GOOD performer.
I have also ordered the 1208 six meter transverter kit.

This, and the previous post by about deciphering motorola units
wants me to add my vote for more info about the above radios. I
do see at least couple of vendors at every hamfest with a ton of
motoral gear, but I don't go near because I don't know what to
look for. I would like to get a cheap VHF radio for home use,
for packet and the local repeaters. This needs only few channels
-- two for packet, and atmost another four for the repeaters I
around the area. Actually, I could even get a separate radios for
packet and the repeaters, and maybe even one for UHF, before I hit
the price of a dual band mobile, in this price range, if only
I knew what to look for. So, could someone knowledgable about the above
radios post some details? It will be much appreciated..

Rajiv,
To help you I would need more information. But at a minimum, you need to have good decoupling caps installed on the PCB. The most common problem with ground noise is "ground loops" or the total ground return path. Thinkl of the decoupling caps as your local power supply, and keep your current path short. Also, are you using a groundplane? Is the xtal flush mounted or in a socket, (if in a socket, try removing the socket.) There are a few good books out there that will help you, one that you might get is from the ARRL, "Radio Frequency Interference: How to Find It and Fix It".

Source record: 225453

I know your frustration in looking for Alinco DJ180T mods. I have not been able to find any FTP sites either. What I can tell you is this. A member of our radio club has one and HAS done the mod. I am not sure where he found out about it though. It seems as though the proceedure is the same as the one posted for DJ160 Alinco radios. This involves removing battery, then removing four screws that hold on the plate the battery attaches to. Now you will see a loop of colored wire near the button that releases the battery. (On my DJ180T, the wire is sort of orange colored). You would cut this wire and tape both ends. Reassemble the radio and reset the processor. (Turn on while holding function and lamp keys I think) This allows out of band transmit. I have no idea how far out of band, but I have heard they will at least work up into the 153 range or so. As you already know, the DJ180T will receive 130-174 right out of the box, so maybe it will also transmit in that range? I have no idea if the mod does anything to extend the receive range beyond 130-174.

If anyone out there knows any mods for the Alinco DJ180T, please post them! We 180 owners would love to know! (Also, does anyone know of mods for late model Azden 2m rigs such as the 5000, 6000, or 7000?)

Remember to try these mods at your own risk! I have seen a modified DJ180T that seems to still work fine, but I haven't had the need or the courage to cut anything on mine!

>japanese equipment never failing.

I've owned it *all* over the years, from Hallicrafters and National, Drake and Collins, B&W and Galaxy, to Yaesu, Icom, and Kenwood. And the rigs that have given me the *most* trouble were by TenTec. In particular was one Argonaut 509 that was a real hair puller. (Turned out to be intermittants in the cheap ass Molex connectors used in the rig.) The *most* reliable radios have been Icoms. My current 735 is a real jewel.

All equipment can fail, I didn't claim otherwise, but the Japanese equipment is the most reliable of the ham equipment available. This is like their other consumer equipment, which is also very reliable compared to equipment made elsewhere. The Japanese have mastered QC to the point where it's rare for a piece of equipment to fail during it's normal design lifetime. Of course if you try to use it for 20 years beyond it's design life, you'll start seeing component failures. Solid state parts in conservative designs are very reliable, most failures today are failures of workmanship in the interconnections of components. The automated equipment used by the Japanese does these connections very well indeed. Manufacturers like MFJ and TenTec don't get the same level of consistency of results.

Yes there is,

<MacMultiCom 1.0>
MFJ sells MacMultiCom 1.0 for their 1278 multimode controller. MacMultiCom supports all of the modes of the 1278: packet, rtty, ascii, pactor, amtor, gray scale faxes, and many different formats of color sstv. The program requires a minimum of a MacPlus and a hard disk. Requires a color Macintosh and System 7 for best results.

Hope this helps,

Sean.

Not all good ham transceivers do. Some, perhaps many, ham transceivers
transmit properly outside of the ham bands if their controllers are
configured ("modified") to transmit there. I use a Kenwood TS 940
for USAF MARS. It has switched low-pass output filter networks,
not band-pass networks, to reduce spurious harmonics.

One thing to keep in mind when looking at old Motorola radios (and others) is the cost to crystal them for the ham bands. For the Mocoms, Micors, etc., you'll need a pair of crystals for each frequency. Crystals run at least $12-15 each, so you're looking at $25-30 per channel. That's nearly $200 for 6 channels. Add to that the cost of the radios themselves, a service manual which you gotta have if you're going to fool with the radios, the cost of any extra parts needed for the conversion, and you're in the ballpark cost of some new radios.

Some of the commercial radios are good, rugged units (I have some myself) but be sure to investigate all the costs before taking the plunge.

Just my $0.02 worth...

3035. Need help with TACTEL HJAL5 450MHz HT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-21 20:04:18 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <swood.774821058@vela.acs.oakland.edu>
Source record: 225459
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I picked up a couple of business radios in a swap of an HT not too long ago. I was interested in converting these to work on the ham VHF bands. (I was told that they were 150Mhz rigs) Well, surprise, surprise... They are 450 MHz rigs.

Anyway, I am first interested in the best place to get crystals to operate in the 440 MHz band. What formula do I use to get the operating frequency? (Or will the crystal manufacturer be familiar with these radios) Is it necessary or preferable to do any tuning of the circuits in these radios and if so how?

Lastly, if anyone is familiar with these radios and can save me some time in figuring out the SP/MIC pinout for the speaker mike, as I plan on using these to run some fixed packet operation at home.

Thanks...

swood

jcmiller@turquoise.usafa.af.mil (Jeff Miller, Homer Simpson's alter ego) writes:
>More importantly, how do I decode the
>alphanumeric codes to figure out what band a particular Motorola rig I
>might run across at a hamfest covers?

Moto uses a simple code for most of the radios you're going to see at
the swapmeet. Here's a typical one to decode:

T74RTN-3100A

T - trunk mount (i.e., separate control head)
7 - 150-200 watts input power (typically 100w out)
4 - band 4 = 406-512 MHz (or some part of that range)
R - receiver model R
T - transmitter model T
N - power supply is the vehicle or battery

3 - PL (CTCSS encode/squelch)
1 - single freq (not always, could be other options)
00 - no special options

Most important to hams, I would guess, are the power and band
designators. These are from memory; I don't recall all of them.

Power
0 - no tx (receiver only)
2 - 2-5 watts out
3 - 20-30 watts out
5 - 50 watts out
7 - 100 watts out

Band
1 - 30-50 MHz (usually in 3 separate ranges, only H or HH range will
easily make it into the 6m ham band.)
2 - 75 MHz
3 - 136-174 (usually in two ranges, 136-150, 148-174)
4 - 406-512 (three ranges, 406-420, 450-470, 470-512)

For a full list, consult older Motorola books. Newer models have more
letters and numbers and are similar to this scheme, but more options are
available so the system got more complex.

P.S. I recommend avoiding MICOR mobiles as repeaters these days. They
are quite wasteful of power, and you can't get many replacement parts
anymore. Use a MITREK.
- Brian

3037. ICOM W2A CONNECTOR

Ne> DOES ANYONE KNOW WHERE TO GET THE ODD DC POWER CONNECTOR FOR THE W2A
Ne> HT (OTHER THAN ICOM)?

I haven't found one... but I've made the one that came with my charger do multiple duty. All of my radios use an in-line connector for 12 volt power, so all cables and power supplies are interchangable. I use the old, round Cinch-Jones 2-pin connector (smaller pin <+>). Some of the newer connectors may be better.

By the way, our local ARES group recommended that EVERYBODY use this connector, so everybody's radios are compatible with everybody's power supplies. Hasn't caught on big, but a few of us are doing it. I've seen the same technique recommended in QST, but with a different connector.

From: briane@iaccess.za
Message-ID: <30moo3$3fs@goofy.iaccess.za>
Source record: 225461

I have the opportunity to acquire about 50 Motorola MCX100 transceivers, from my company, which is upgrading its comms. They are presently programmed for Tx 146 Mhz and Rx 153 Mhz at deviation of 2.5kHz.

The EPROM used in these sets is labelled 494PGL1004A. We can obtain blank EPROM's for about US$3.00 each, but no-one can tell us how to burn them to operate in our VHF 2m band (144-146Mhz in South Africa). We have contacted the local Motorola agents, but they are either unable (or unwilling??) to assist us.

The info that we require is the name address, fax number, e-mail no. etc of some companies in the USA that would be prepared to burn new EPROMS for these sets. Payment would be in US$ to the bank of their choice, airfreight would be minimal.

It is our intention to set them up and sell them them at cost to our new young amateurs, to get them started on VHF. Cost of the sets is US$10 each, plus the cost of burning the EPROMS.

Hope someone can help us out. E-Mail replies to me or post in newsgroup.

Thanks in advance.

MFJ makes a Multicom software package for the Mac which I think does
everything except SSTV. Most third party Mac terminal software will
work for the text modes (packet, RTTY, Amtor, etc.). A standard Mac
modem cable will work fine, too.

1) Dig a big hole about 6 feet deep and 4 or 5 feet around.

2) Place a steel tower section base in the hole.

3) Fill hole with concrete to about 6" below grade level.

4) Erect tower to desired height (50-75 ft. is usually good enough).

5) Liberally decorate tower with antennae both large and small.
A blinking red light is a nice touch.

6) Backfill the remaining 6" above the concrete with topsoil and
water liberally.

7) Insert seeds for desired flowers (roses) about 1/2 to 3/4 of
an inch below the surface.

8) Wait for flowers to appear. Operating radio equipment connected
to the antennas on the tower will help make the time pass quickly.

Gary

I can't speak for all Japanese / American equipment but as an EE who has spent the past 8 years working with Japanese manufactures both here and in Japan I do have this to say.

The level of automation in the area of assembly and test of electronic subsystems is about the same for both Japan and the US. US labor costs makes the use of Japanese robots necessary to be competitive in the world market. The best electronic subcontractors in the world use Japanese robots to assemble and HP test equipment to test.

Product life and early life failure is more a factor of design rather than process. I have worked with both Japanese and US designs over the past 25 years and I'll take a US design over a Japanese design any day. US designers tend to be more willing to use new materials and large scale integration, than their Japanese counterparts. The Japanese designs I have worked with have been loaded with transistors that should have been placed into one package and the use of pots where a fixed resistor should have been designed in.

I firmly believe the old (Made in Japan = GOOD --- Made in USA = BAD) Quality statement is untrue in today's world. It's time to take another look.

Hello,
I have a htx-101 which I power off a 12 volt power supply
in my shack. I'd like to start using in from my car. I
have used my 2m ht powered by the cig lighter but that
doesn't draw near as much as the htx-101.
I have the instructions for attaching it to the electrical
system but I was looking for something a little less instrusive.
The htx-101 can put arod 6amps as transmit (I think...)
What do you think?

Look for walkies in the GMRS. (General Mobil Radio Service). These low cost commercial radios require a license, but it is only a formality ($35 from FCC). They operate on UHF and provide excellent quality sound at prices from $200-350 (perhaps less if you hunt around). Radio Shack sells them. Go look there, but hunt around for cheaper prices. You can set up repeaters and other neat stuff. There are restrictions as to use, but you can do almost any reasonable type of communications. Power is restricted to 2 watts (I think). GMRS is a very nice service and is generally overlooked by consumers.

After about five years of thinking about it, I'm finnaly going to get my ticket. I've got access to good HF gear, but I'd like to get a handheld.
I'd like something which will allow me to use autopatch, have adjustible power levels, have a good reciever (not nessisarily out of band, but that would be nice.), I don't need any real fancy bells and whistles. What I want is a bulletproof radio. That is something close to or up to mil/police spec. Most of the new gear I've looked is tiny and delicate. I don't mind carrying a brick as long as it works.
So far Yaesu FT-411E looks promiseing but I've yet to see one in person. The same for some of the Standard Radio units, but they are very expensive. I'm certainly willing to look at used gear. Any suggestions about possible good used rigs info about the models abo, or other new rigs would be greatly appreciated.

End of line...

Hi Jeff. I have a Kenwood TR-7950 that pulls about 10 amps on high power and I regularly use it with a cigarette lighter plug. I use it when providing communications for bicycle rides when I ride in other people's vehicles. No problems so far.

The sturdiest radio in my HT arsenel is my old Icom 2AT. It is really
nothing fancy -- thumbwheel switches, no scanning or memories, and
certainly bigger and heavier then the micros. But its taken a licking,
and suffered one small crack in the case to show for it... since
1976. Icom is still selling this radio!

>The htx-101 can put arod 6amps as transmit (I think...)

Is this the same as the HTX-100?

I have used my HTX-100 mobile, with a 12 VDC connector wired in
parallel with the cigarette lighter socket. No problems blowing fuses
or anything like that. I think I might have less problems with
ignition noise if I had wires running directly to the battery, but the
unit's noise limiter is very good and at 25 watts PEP to a 4' (short)
CB antenna I don't think I could work the stations I can't hear,
anyway.

Radio Shack has a pretty good service manual for the HTX-100, well worth
the price of $8 or $9. The following are the specs on battery drain:

nominal maximum
SSB max PEP, two tone high power 3.2 A 4.5 A
" " " " " low " 1.6 A 2.5 A
CW max carrier, high power 5.0 A 6.0 A
" " " low " 2.4 A 3.2 A
receiving, no signal 500 mA 800 mA
" max audio output 1.0 A 1.5 A

I got my HTX-100 3 years ago to entertain myself on a solo drive from
New Mexico to Massachusetts, and I had a lot of fun with it back then
when 10 meters was regularly open. I'm not sure I would choose a 10
meters only rig for h.f. mobile in the current phase of the sunspot
cycle.

The closest thing I've seen to that is the Icom IC-2AT. It's a very
good basic 2 meter HT, and I've seen those things take unbelievable
abuse and still keep working.

This is true for big, high volume US manufacturers, but not for the likes of Ten-Tec or other small US manufacturers. I'll grant that Delco uses as advanced assembly methods as anyone. Other high volume sales companies do as well. Ten-Tec does production runs in the *hundreds*, not the hundreds of thousands.

It should be noted in passing that Japanese companies have been moving some of their production out of Japan because of *their* high labor costs. Some of that production has found it's way to the US where they can take advantage of "cheap American labor". (See Kawasaki's Lincoln Nebraska plant)

> Product life and early life failure is more a factor of design rather

Japanese designers *do* tend to be conservative. That's not always a fault for amateur use. It makes their equipment easy to modify. There's no doubt though that fewer interconnections mean fewer failure points. Again, this simply does not apply to Ten-Tec. Their designs are, if anything, more conservative than even the Japanese.

> I firmly believe the old (Made in Japan = GOOD --- Made in USA = BAD)
>Quality statement is untrue in today's world. It's time to take another look.

That there is quality US electronics is not in dispute. What is in dispute is whether the likes of Ten-Tec and MFJ fall into that category. They still rely on hand soldered thru-hole mount assembly of fairly low integration designs, often with lots of interconnecting harnesses of relatively poor quality. (Note please, I'm not saying to avoid them like the plague. They still make usable equipment. It's just that holding them up as of superior quality to Japanese equipment (or to better quality US equipment) isn't valid.)

>the greatest but I can hear LAPD on 506 Mhz just fine.
>
>I'd be curious to know just how far up you can go before the VFO unlocks.

I thought the tricks needed to program above 500 were pretty well known,
but apparently not. I found the instructions appended to one of the FT-530
modification files that float around the various FTP sites.

In any case, my 530 happily locks on the UHF side well up into the 800s,
picking up PECO Energy (AKA Philadelphia Electric), among others. I'm sure
it could pick up cell phones, but of course that would be illegal, so I
would never personally do it. The only slight problem is the enforced 12.5 kHz
step size.

Have fun with it!

3064. MOTOROLA MCX100 - Help needed.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-22 19:21:12 UTC
From: briane@iaccess.za
Message-ID: <30p678$67p@goofy.iaccess.za>
Source record: 225491

I have the opportunity to acquire about 50 Motorola MCX100 transceivers, from my company, which is upgrading its comms. They are presently programmed for Tx 146 Mhz and Rx 153 Mhz at deviation of 2.5kHz.

The EPROM used in these sets is labelled 494PGL1004A. We can obtain blank EPROM's for about US$3.00 each, but no-one can tell us how to burn them to operate in our VHF 2m band (144-146Mhz in South Africa). We have contacted the local Motorola agents, but they are either unable (or unwilling??) to assist us.

The info that we require is the name address, fax number, e-mail no. etc of some companies in the USA that would be prepared to burn new EPROMS for these sets. Payment would be in US$ to the bank of their choice, airfreight would be minimal.

It is our intention to set them up and sell them them at cost to our new young amateurs, to get them started on VHF. Cost of the sets is US$10 each, plus the cost of burning the EPROMS.

Hope someone can help us out. E-Mail replies to me or post in newsgroup.

Thanks in advance.

Cheerio,

3066. Re: Comments on SGC's SG-2000 HF Radio?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-22 20:05:49 UTC
From: gc@sirius.ccd.bnl.gov
Message-ID: <1994Jul22.200549.23548@bnlux1.bnl.gov>
Source record: 225403

I bought an SG-2000 and SmartTuner and installed them on my boat
for a recent trip to Bermuda. However since my license did not
arrive until after I was back (see all the recent comments - I saw
14 weeks from exam to license) my only experience was on the marine
bands.

The antenna was an old mizzen stay (about 23 ft long), insulated
and run up to the main mast from the cabin top. It is far from optimum
and will be the next thing I work on improving. However the tuner
loaded it up fine on all bands that I tried (including 2182 Khz).

The receiver seemed good, stable and reasonably clear. The audio
quality is clearly aimed at understandability not fidelity (in other
words it is understandable, but not high fidelity). The transmitter
audio received similar reports. Construction quality seems high.

My main complaint is in the user interface. In the conversion to
an all push-button system with no knobs there are some pretty awkward
things left. There is an excessive reliance on timeouts to get out
of many modes (eg setting squelch levels) and as a result they have
the timeout set so low that many times you get timed out trying to
do normal things (e.g. enter a frequency that you have to look up
somewhere). They have two keys (up-arrow and down-arrow) that replace
knobs, however these are badly overloaded. It is like having only one
knob on a traditional set and a set of switches to determine what it
does. A minor complaint is that they do not have a calibrated S-meter.

The set that I had died in Bermuda. After some phone calls I sent it back
and they sent me a new set. Unfortunately I had to pay shipping both
ways which, because I was in a hurry, was very expensive. Otherwise
I would rate their customer service pretty highly. (By the way I suspect
the problem in the set was software, there are several microprocessors
in the system and the one in the control head lost communications with
the one in the transmitter)

3067. HELP-getting sticky velcro tape to stick?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-22 20:12:37 UTC
From: markeh@netcom.com
Message-ID: <markeh-220794121237@markeh.slip.netcom.com>
Source record: 225492
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment

Maybe someone here has some help for my problem. I have a mobile in my car, mounted in the trunk, with the control head stuck to the dash with sticky velcro tape. Well... not very sticky, since it keeps falling off.

I seem to have partially fixed the radio side of the problem, by using strips of tape long enough to extend around the end of the control head and wrap around the ends. But I havn't been able to solve the dash side of the problem - the tape unsticks, and falls off after a few days.

For several reasons, drilling holes is a poor solution, hence the velcro tape.

Any suggestions???

Help much appreciated,

73 Mark KM6FM

|>

There was a scam several years ago (about 1989, if I remember correctly) involving a so-called Atlas rig. It was advertised in several of the amateur publications, and many people sent in their money. No one ever received any radio, and most were unable to get their money back. The perpertrator was convicted of mail and wire fraud. I can't remember his last name, but his first name was Michael, and he held a Technician class license. This was his second conviction for this type of scam (both were run under the name Atlas). I don't know if he's at it again, but it certainly sounds like the same MO. I'd be very leery of this operation.

I have a TS450 and i love it. I bought it after comparing specs on the
mid price range between Kenwood, Yeseu and Icom. I was after something
that would run reasonable power key-down, that has RSK and that had good
filter options. For my needs, the Kenwood was the one.

Just to be sure, I asked around and found few who did not like theirs.
Any troubles were trivial. One neat feature is you can select the IF
filters selectively. And you can add three optional filters. so, when I
am listening to AM SWL, i use the 6 k/c positon on both. On SSB, I also
use the 6 k/c but switch the 1st IF to a 1.8 k/c optional filter if
there is a lot of QRM from adjacent stations. ON CW,
I use a 200 cycle filter (another option) and on RTTY I use a 500 cycle
filter in the 2nd IF.

Another good feature is the memories. The rig remembers which filters
and switch settings I use on different bands and sets everything as it
was when last used.

As for freq stability, I did have a small problem. I noticed that I was
a bit off everyone else on rtty (not a problem on SSB). The rig worked
fine, but it is just that I was a digit off on a prearranged QSO. Not
really stability, just a bit off freq.

So, I tuned in WWV and sure enough, there was a 150 cycle difference.
The instructins how to fix this are in the book. They involve using a
small tuning cable. Well, sure enough I either lost it or never had it.
But, I reasoned that if I coudl hear the beat on WWV, why not give the
tuning cap a little tweak (it is located through a small hole under the
speaker. had to take the speaker off and took off the cover below like
the book said and tuned it up fine. Then i noticed the little hole in
the cover. don't know why they say to take the cover off when they put a
hole for a tuning wand! TMALSS, it works fine. I get a bit of drift on
the first 5 min of warmup and that is it. Never had a complaint on RTTY

and that is where you would get one.

btw, you can get an optinal high stability TCXO, but I cannot imagine why
you waould want one, the rig is nice and stable after only a bit of warm-up.

I own the Radio Shack Frequency Counter and it works fine
for scanner enthusiasts and it is only 99$. Features are lacking on it. My
only complaint is that there is no hold button. It is hard
to remember the freq. it counted before it disappears. The
only features that it has is you can select the gate time
fast or slow the faster it drops a decimal example....
870.3451 on slow gate or 870.345 on fast gate. It should
not mater if you are using it as a scanner tool. You can
also select the input type 50 ohm or Hi-Z. Hi-Z is used
for hooking it to the output of an oscilloscope. I have
had great fun with my counter. Especially when you are
driving and you see some one on there cell phone. You pull
up next to them and turn on the frequency counter. You
wait for it to register the cell frequency and then punch
it in to the scanner it is laughs. It works great for
finding those unknown frequencys. People do find it quit
strange that you are following them with this strange
device. I will include the Frequency Counters
Specifications they are as follows...........

LCD RF
Frequency Counter Cat. No.22-305

Gate Time .... 64 ms (Fast); 640 ms (Slow)
Display .... 8-Digit LCD
Display Update Rate .... 128 Ms (Fast)
1.28 S (Slow)
Display Resolution .... 1 kHz (Fast)
100 Hz (Slow)
Accuracy (when AC powered):
1 ppm +/- 1 Least Significant Digit
Operating Temperature:
+ 64 F (18 C)/+95 F (+35 C)
Power Requirements:
4 x AA Alkaline Batteries
4 x AA NiCad Batteries
or any 9 VDC Power Adapter - Center

INPUT CHARACTERISTICS
Range .....1 MHz to 1.3 Ghz
Sensitivity .... 150 mV min. 1 MHz to 1.3 Ghz
see table 1
Dynamic Range .... 10 mV to 1 V rms
Coupling ..... AC

Input Impedance ..... 50 Ohm or Hi-Z
Absolute Maximum Input Level ..... 1.4 V p-p
(You Might damage the counter
if you exceed this level.)

TIMEBASE

Frequency ..... 4 MHz
Initial Accuracy ..... 1 ppm

Typical Input Sensitivity (50 Ohm Mode)

Frequency (MHz) Sensitivity (mV)
0.2500 100
0.3000 60

I don't know about this "scam", but the Atlas radio company is real
and has built several decent radios. The latest advertised was
the 310, and it was not a hoax, I worked a prototype..... The owner
of Atlas radio is down near San Diego, and you can talk to him on
the phone. (His name is Herb, he used to build Swan radios).

It is true that he advertised his radios a year ago and I have never
seen one delivered. This may be due to his overextending himself or
technical difficulties - neither is excusable. However, Herb is not
a bad fellow to my knowledge.

3086. Azden PCS-4000

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-24 05:51:04 UTC
From: dhartzell@ins.infonet.net
Message-ID: <30svg8$rrv@insosf1.infonet.net>
Source record: 225433

I have an Azden PCS-4000 2m rig. I recently replaced the s-AV7 power module in it . This seemed to take care of the low power output problems (200mw). Currently it puts out about 17-18 watts, but should be putting about about 25. I can adjust the peaking controls to move up to about 25 watts, but then the power just drops back down to 17-18 watts.

Some people have suggested replacing the PIN switching diodes. I do not have a service manual, though. Does anyone know where these diodes are located, and possibly what type they are. Or does anyone have any other suggestions as to what I might do to fix these problems?

Any help or suggestions would be greatly appreciated, Thanks, Dave N0TGD

We have an SG-2000 aboard the SS Lane Victory (a WWI Victory ship that has
been made into a living, operationa museum. It is located in San Pedro, CA
and I am active in its radio group)

I agree with above comments but would add a few more:

1. The radio is obviously designed for commercial operations, where most of the time one selects pre-programmed stations by entering a channel number (a lot (400?) commercial SSB station frequencies are built into the radio's ROM) and it is pretty awkward to tune to an non-programmed freq, like you might want to do if you were using the rig for ham operations.

The only way to change frequency incrementally is by pressing either the up or down arrow key. The frequency moves in 0.1, 1, or 5 MHz (I think) increments; changing the increment is not hard but is a awkward.

2. If you want to use CW, you can either connect the key to terminals in the back of the radio, in which case no side-tone is generated, or across the mike switch.

And, when using CW, you must manually calculate the frequencies to set the xmtr by subtracting 1 KHz for the xmit freq and the freq of the audio tone you want to hear (like 800 HZ) for receive.

3. Shortly after getting the radio we had to replace the backplane to cure intermittent problems. Not hard but annoying. Even now, the radio occaisionally (sp?) locks up and the entry keys stop working. The last time I was able to restore operation by pressing the 2182 button (power up and down didn't help!)

Following software now available from

ftp.demon.co.uk /pub/ham/mac

INDEX OF MACINTOSH AMATEUR RADIO SOFTWARE

****

ANT RAD PLOT.sea
2K Basic programme plots vertical radiation pattern for dipoles at any given height.

BROADCAST v2.0.sea
150K Packet program for use with PACSATs.

CODEMASTER v1.34.sea
27K CodeMaster 1.34 - demo version of CodeMaster 2.34 - morse code and ham theory test application. This version is somewhat functional.

CONTEST DUPER v5.1.sea
70K Checks your contest log for duplicate entries.

CW CHART.sea
3K Copied from Usenet - a morse code (CW) tree chart.

DXCC by Callsign.sea
30K DA which lists all the DXCC countries in order of callsign.

DXCC by Country.sea
30K DA which lists all the DXCC countries.

EZ DOVE v.002.sea
55K EZ Dove decoder (v.002). Appl and Basic source, decodes Dove telemetry data.de N5KOB.

GRID 1.0.sea
9K Converts longitude/latitude to grid QTH

HF PACK TUTOR.sea
9K Tutoral on HF packet radio - interesting

HAM ART.sea
11K Assorted ham related artwork. ARRL and AR TIFF logo, IC-735 front(MCDW)

ICOM & MACS.sea
1K Info for Mac & ICOM owners looking for software to link'em

IM/Mac v1.0b27z.sea
200K SMTP mailer for use with NET/MAC.

KISS_TLM.sea
50K For decoding KISS data from MICROSATs.

MacContest 4.0.sea
300K The ultimate contest logging program for the Macintosh.
MacContest is free but must be personalized to each user
(otherwis it's limited to 50 contacts). To get a copy send a 3.5" diskette and
a SASE to Gerald Eberle, HB9CEY, PO Box 13, CH-4417 Ziefen,
Switzerland. Moritz (HB9BLZ) can act as a message forwarder for Gerald.
Moritz' e-mail address is: gysslerm@saturn.kau.roche.com

MACMORSE v0.2.sea
30K Another program to learn morse code

MACMININEC v3.13.sea
250K For analyzing antenna disgins,including dipoles, beams, etc etc.

MORSEMAC DA v2.0.sea
17K A program to learn Morse code . It sounds a preset number of characters
randomly choosen. it contains an XCMD written by LX1YZ

MORSE v1.3.sea
20K Morse tutor up to 25wpm, very good.

MAC SHORTWAVE v1.sea
90K Shortwave propagation predictor.

NET/MacStartersKit.sea
500K A complete starters kit for the Mac user interested in trying TCP/IP.
Includes everything that you will need to get going.

NET/Mac v2.3.39.sea
500K This is a version of TCP/IP. Will allow you to use AX25, NETROM, FTP,
TELNET and SMTP with packet radio

ORBITTRACK (2 versions)
514K This is one of the best Shareware progarmmes I have ever seen. If you are
interested
in tracking sats you need this. Comes in two versions, one for use with Macs
that have a FPU
processor installed and one which will run without a FPU for those that don't.

PACKET(1-18).sea
43K Introduction to packet radio - Parts 1 thr 18 by Larry Kenney, WB9LOZ

PacketTracker 1.04.sea
110K PacketTracker ver 1.04 is a program that monitors packet activity
and keeps track of what is going on. It draws a graphical map
showing who is talking to who and displays statistics of all current
stations and keeps a running tally of activity.
NOTE: This application requires the Apple's Serial Tool from the
Communications Toolbox System 7

PROJECTMAC A1.sea
105K ARRL's Project Mac software - part A1 (These are looking a bit old now)

PROJECTMAC A2.sea
118K ARRL's Project Mac software - part A2 (These are looking a bit old now)

PROJECTMAC B1.sea
103K ARRL's Project Mac software - part B1 (These are looking a bit old now)

PROJECTMAC B2.sea
107K ARRL's Project Mac software - part B2 (These are looking a bit old now)

QUICKTERM.sea
Another of Gerald Eberle, HB9CEY contest/dx programmes. This one is a AX25
terminal programme for use with the DX cluster, will "ANNOUNCE", DX spots
(using MacInTalk), when they arrive at the cluster.

RADFAX 09.sea
173K WEFAX programme that uses the mic input on new Mac. No other hardware
required,
just plug output from HF rig into Mac mic socket and away you go.

SAVANT 1.0.2 Demo
185K AX25 packet terminal programme that will work with SoftKISS,
in other words it will allow you to run a Baycom modem on the Mac.
This is now a commerical programme but the demo version will let you
set it up, send a limited number of frames and see it working etc etc.

SoftKISS 1.8.sea
This will allow the use of dumb modems with the Mac, ie the BayCom series
of kits.

STARTING IP v3.0.1.sea
14K The Getting Started with (Mac) TCP/IP text file for beginners

SUNTIMER.sea
130K One of Gerald Eberle, HB9CEY contest/dx programmes. Shows Grayline
on world map, distance, bearing, DXCC callsign lookup table, very very nice
programme.

TALKTERM 1.1.sea
50K For use with DX clusters. If used along with MacinTalk it will announce
DX spots as they arrive on the cluster.

Various Logs.sea
200K Includes,
FileMaker Log, 5K FileMaker IV document will provide excellent general logging.
HamLogger, 10K HC stack for logging ham contacts - very nice.
Logging Stacks UK, 100K Keeps all sorts of logs. From contest, to local
directory.
Logging Stacks USA, Same as above but with USA bandplans.
MacLogger, Very nice programme for checking contest entries.
SWL Logger Stack.

Virtuoso v1.4.sea
68K A very nice standalone packet terminal programme for use with any TNC

****

HYPERCARD STACKS.

Advanced 2.2.sea
132K HC stack - Ham advanced test.

CHESS-STACK.sea
143K Yep, someone had to do it. HyperCard stack that will allow two
Macs to play chess via packet radio.

DXMAP v1.1.sea
150K Shows grayline in real time, also has a data base of all callsigns and
will show location and bearing from your QTH on world map. Very nice. Can
only can only be used with version 2 or higher of Hypercard.

Extra 2.2.sea
127K HC stack - Ham extra test.

FreqValet Demo version.
203K Provides frequencies and DX program info for shortwave radio
listeners. The program databases update automatically at 15, 30, or
60 minute intervals, thus providing a continuous display of
broadcasts on-the-air at any given time in a spreadsheet like
format. Features include sorting of data, scanning, and on-screen
changing of databases. Computer control modules are available at
extra cost for the Drake R8, Kenwood R-5000, JRC NRD-525
and NRD-535 receivers.

General 2.2.sea
93K HC stack - Ham general test.

GRAYLINE.MAC.sea
70K HC Shows world grayline in real time.

HyperFT747GX v1.1.sea
250K HyperCard that will allow you to control your Yaesu FT-747
via the RS232 interface. This stack should be pretty easy to
modify to work with other transceivers. It also now comes in
a coloured version

NOVICE 3.2.sea
128K HC stack - Ham novice test.

SSB.sea
500k With this one you can record your own voice, using MacRecorder or
similar and then at the click of a mouse call CQ, QRZ, etc etc.

Tech 3.3.sea
108K HC stack - Ham tech test.

Trans.Stk v1.0.sea
32K A stack I made for transmission lines, giving attenuation, SWR, etc

Logging Stacks USA, Same as above but with USA bandplans.
MacLogger, Very nice programme for checking contest entries.
SWL Logger Stack.

KQI Control v1.sea
53K Hypercard stack that will allow you to control a Kenwood TS-940S via
it's RS-232 interface. However the author feels that it should work with most
of the Kenwood range of transceivers.

Macnet rouster v 631
Worldwide database of Ham Macintosh users.

Mac To PC.

ZIP.sea
Will allow ZIP or PKZIP files to be exchanged between Macs and PCs.

3090. Icom 735 key clicks

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-24 09:55:52 UTC
From: dhb@netcom.com
Message-ID: <dhbCtFvL5.AHr@netcom.com>
Source record: 225413

My Icom 735 is generating key clicks when I operate in CW. Scoping the output reveals that the carrier turn-on is less than 1 ms, with turn-off around 2.5 ms. The turn-on is clearly too fast.

Checking the schematic, I see two RC networks in the keying chain, but both appear to shape carrier turnoff; key-down seems to ripple right through. Am I missing something here?

If anyone has encountered and resolved this problem, or has first-hand knowledge of the 735's key shaping circuitry, I'd appreciate an email message to dhb@netcom.com.

Thanks,
Dave, AA6YQ

>
>Clark
>WA3JPG

It is true that Herb *continues* to advertise the phantom 310...
apparently the *new* digital domain (as opposed to the analog
design of the 210) was improperly engineered and ended up with
lots of birdies....and had to be redesigned...hence the unbelievable
delays.

Perhaps advertising dollars are short and that is why the ad now only
appears in CQ magazine. :^) On the other hand, maybe QST quietly
told them to stop advertising until it ships? Wh knows? But I
do know that CQ will take ad money from anyone...like that ad in there
for a box that will match any antenna to 50 ohms without any tuning
adjustment (i.e. an encapsulated 50 ohm resistor according to ARRL's
xray technician). ;^)

>Help much appreciated,

>73 Mark KM6FM

Use plain old rubbing alcohol to clean the surface of your dashboard before applying the Velcro. It might discolor the vinyl, but the color will come back as the chemicals in the vinyl leach back to the surface. The vinyl in the dash sort of sweats and any kind of vinyl protector like Armor-All leaves an oily coating. The alcohol removes the oil, just like it does the oil on your skin. If you really need a strong bond, you can put superglue on the velcro glue side. This is a pretty permanent mount, though, and will damage the dashboard. If you use the "industrial" velcro at Radio Shack, like Tom Bodoh suggests, be aware that you will need a something like a screw driver or putty knife to pry the two items apart. That stuff sticks together!!!!!! I have bent the case of rigs and bent mounting brakets trying to get that stuff apart.

3102. FT-530 for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-25 03:48:11 UTC
From: bhackney@picard.infonet.net
Message-ID: <30vclr$g6b@insosf1.infonet.net>
Source record: 225434

I have an FT-530 Dual-Band HT for sale, it is a Yaesu radio, 6 months old.

Asking $406 OBO.

Two Antenna's (Duck, and telescoping)
Power Supply
1 7.5 Volt Battery Pack
All docs
Hand microphone

Features:

Control and Listen to 2 differnt freq's at the same time.
Has 4 sperate VFO's.
About 60 memories.

much, much, more.....E-mail for more information..Do it fast I only got one of these!!

Reason for selling is I gotta new rig.

Ben Hackney Bhackney@picard.infonet.net

3103. For Sale: Yaesu FT-890AT HF rig

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-25 05:39:49 UTC
From: paulf@galena.use.com
Message-ID: <paulf.775114789@galena>
Source record: 225426

For Sale: Yaesu FT-890AT HF rig. Includes built-in antenna tuner, MARS/CAP mod, box, manual, registration card (never filled out), and original invoice.

Paid $1199.00 new. Rarely used due to the fact that I can't put an antenna up and I don't use it mobile. In fact, probably only used 5 times.

Will sell for $999 including UPS shipping. Email paulf@use.com or call 317-290-5207 (voicemail) if you have no Email access.

I echo these comments. We have bought 7 SG-2000 units with smart tuners,
whip antennas and power supplies.... and the reliability record has been
terrible... we have had multiple radio failures and multiple power supply
failures.... one of the power supplies burst into flames when we energized
it. Although it is claimed that the 8 foot whip antenna will load up down to
2 MHZ, one of our assigned frequencies is 2.018 MHZ and we have had many
many problems getting the units to load up at that frequency... We selected
these units because we wanted reliable units with easy operation.... It
seems we were wrong....

However, the smart tuners are great........

Hey Jim, wanna bet? Here's what you do:

1. Put on some bib overalls and a ballcap that says "My wife - yes, my dog - maybe, my gun - never".
2. Go to 7-11 and buy a can of Skoal. You need to have a big chunk of "tobaccy" under your lower lip.
3. Drive to your local RS store and in your best "I am a CBer" accent start asking a lot of stupid questions about CBs. The stupider the better.

You may have to go to two or three stores, but I am 100% certain that you will find someone who will sell you this rig as a multiband CB.

From: ddepew@CHM.TEC.SC.US
Message-ID: <310c83$80n@ns.sunbelt.net>
Source record: 225431

I have a Yaesu FT101-E which needs repairs. The problem is this: when I'm transmitting CW, I get reports of my frequency varying up and down. I've been told it could be a bad capacitor in the power supply, or a dirty potentiometer, or all kinds of other stuff.

Please help me, if you can, with either/both of the following:

a. A SIMPLE approach to checking and repairing it myself. (I have only BASIC equipment...no scope, frequency counter, etc.)

or

b. Reliable and reasonably priced sources of repair...hopefully in the Carolinas or the Southeast.

Does Yaesu still repair these old rigs?

Any help would be most appreciated!

Tnx es 73...

: or other 6m transceivers?

I have a Yaesu FT-690R II and have been very happy with it. Only drawback is, with just 10 watts, it's hard to break into pileups, and sometimes frustrating when band openings are weak. If you want more power, try the Kenwood TS-60, with 90W out. (Also more $$. :)

Niels Jensen (nielsj@sad.hp.com) wrote:

: I just purchased a IC-2GXAT from HRO in Alameda. The sales
: guy told me it was possible to receive over a wider range than
: 144-148 MHz using a keystroke sequence. He didn't know what it was.
: Anybody know or believe this?

: Anybody know of mods that can be made for this radio?

Well, I found out one mod myself:

I called HRO back, and this is what they told me:

1) Turn tranceiver off.

2) Simultaneously hold down the F, SCAN, and DUPLEX keys while
while you turn the radio on.

3) Wider coverage of receive should be enabled.

I did this and it worked! The receive coverage seems to be 50 - 200 MHz.
It actually isn't as wide as this; I tried the FM broadcast bands and
there was nothing there. I think the actual coverage is 136-174 MHz,
since that is what the radio is specified to do, at least in Italy (look
in the manual).

I also wonder what else keystroke combinations might do; HRO didn't know
or wouldn't say anything about any others. If anyone discovers anything,
please post it!

Thanks,

Niels Jensen

From: e-reuter@uiuc.edu
Message-ID: <e-reuter-2507941211310001@skywalker.ccsm.uiuc.edu>
Source record: 225440

Does anyone have any comments about the new Icom 2m/440MHz handheld, the IC-T21A? I am considering purchasing this radio, but I would like to hear what others think of it. Also, the regular ftp sites don't have extended transmit mods for this radio, can it be modified for extended transmit?

I am also considering the Yaesu FT-530, which costs about $100 more than the Icom, but I know a lot more people have the 530, and the extended tx mod is available.

Ideal information would be a comparison between the IC-T21A and the Yaesu FT-530.

Thanks, eer

You get 7 characters per memory channel and it's a full ISO8859 character
set as far as I can tell: upper and lower case, all punctuation,
International language accent characters, plus some unusual looking
stuff. The knob inside (above) the right volume control is a "step"
switch that allows you to move up or down in whatever mode you are in.
You also get to program in a 7 character power-on message.

Does anyone know how much a used Kenwood TS-520S HF rig is worth?

I am considering buying one and have little experiance with hf rigs.

If someone could share any experiences with that radio or give any suggestions

I would appreciate it very much!

Thanks,

Scott Sidener sidener@umr.edu N0WFL

3120. RS 440 Rig, Bad?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-25 20:08:32 UTC
From: R0264@vmcms.csuohio.edu
Message-ID: <16FFED4F0.R0264@vmcms.csuohio.edu>
Source record: 225444

Last Fri. I got a HTX-404, took it home, tested it, and it seemed bad. On Sat. I took it back, and they got me another one on Sun. I took it home and tested it, and it seemed bad too. Being inexperienced on the 70 cm band, I'm wondering though if the problems were caused by something I was doing.

Symptoms: I can key a local 146.790 (-600) repeater on 446.785 with the HTX-404, and hear some locals talking with their 2m rigs on that freq. That repeater is only about 1/2 mile from my site, but on Sun., I also found I could hear the 147.120 repeater in Canton, from my site in Cleveland (distance of about 60 miles) with my HTX-404 on 446.950. In both cases the HTX-404 was set for simplex. I must have been transmitting on the input, 146.190, of the nearby repeater, and I surely must have heard the output of the Canton repeater, since I copied its ID, WD8AYE.

I talked simplex to a friend with a 70 cm rig, about 1/4 mile away, on 446.000, and things seemed normal with that operation.

I'm taking the HTX-404 back for a full refund, as I think it must have a design flaw, but I would be curious to know if there are other possible explanations of these strange phenomena. -- Phil Emerson, aa8jo.

3121. Wanted: Portable full band scanner

Newsgroup: rec.radio.amateur.equipment

Source record: 225445
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,alt.radio.scanner

I'm looking for a portable-type scanner (doesn't have to be a small handheld model, but battery/DC powered and can be carried around semi-easily) that will monitor the 45-50 Mhz and cellular band. A headphone-out and/or RCA plugs would be nice. Not willing to spend over $200, and even a rather junky yet still operational scanner would be nice.

Mail me with:
+ Make, model, year, etc.
+ Price new
+ Your asking price

Suggestions are also welcome, as I'm still a newbie at this.

My guess is you've stumbled onto link frequencies for those repeaters.
Either that or someone's set up a crossband radio in your area to
repeat from 440 to the 2 meter repeaters.

Before you go and exchange that rig, have you asked anyone else if
they can do the same thing? It is quite possible that these 2m repeaters
have remote bases (possibly undocumented) operating on the 440 band.
If this is the case, you're symptoms would then be a feature,
since you can access 2m repeaters with your 440 rig. From the ARRL
directory, it appears that Ohio only uses the 442-445 subband for
repeaters. That would leave 440-442 and 445-447 open for this kind
of remote basing. Anyone from 8 land know?

I recently purchased a FT-416 and am wondering what all you out there think of this model. Is is Good, Bad, or OK? Anyone know of specific problems or things I should watch for on it? Also, I haven't been looking long but I can't find much on this radio. Is it just really new or just ignored by most people?

Finally if you have any interesting Mods, I wouldn't mind if you send them my way! :)

Thank you!
Todd Velie

>>and work better that an equivalent ken or yaesu, and
>>when i call TT for some info, i get info! not a
>>request to SHIP my rig!

You obviously never dealt with any of the Tritons prior to the IV!
You had to sneak up on the VFO to keep it from "pulling" when you
touched the knob.

Or the handy "clean the contacts with an eraser" trick to get you
radio working again.

Even the Triton IV would have a tough time beating some of it's contempories
like the Kenwood 520 for long term reliablility. (Even considering the
Ten-Tec short circuit'able finals.)

When radios went PLL, they could not even start to compete. How long did
it take them to bring out a "modern" (GC rcvr, non-analog) rig? Yes, I
know they finally made their VFO's stable.

I like most of the Ten-Tec gear. But to simply declare all TT gear as
suprior to all Japaneese gear??? Get real.

I have been interested in the TT scout as a "play" rig. Only, they do
not sell through dealers. And they have not attended the Atlanta hamfest
for at least 2 yrs. Kenwood/Yaesu/Icom/Standard/MFG/Kantrionics/Ramsey
were all there) I am supposed to buy one based on a brochure??

Ten-Tec has not changed much since it's inception- Looks interesting,
but usually missing something in the execution. (Maybe this is not true
of the way high end rigs)

I think the original description of "workman like" construction is not
far off. This is not an insult, just an observation. The radios were
pretty straightforward to work on.

Anyway, they all cost too much! :-) (US or imported)

The IC-W2A/E was discontinued many months ago. I think it may have been
in January or earlier. I see it is still being offered by some retailers
advertising in QST so I guess they are clearing old stocks. I have an
IC-W2E and it is an excellent rig though I do agree with the comments
about the power connector and intermod on the 430 band when connected to
the main shack antenna.

I am very disappointed with Icom's replacement rig. Whilst I am not a
Yaesu fan (I am still sore after purchasing an FT-757GX 12 years ago!),
I must say that the FT-530 does look the best of handhelds currently
on offer.

Sounds like the "You Will Burn in Hell" posts elsewhere. It does use up bandwidth. Of course I never check those out. I read about it in Time....

Seriously, roses no longer grow from seeds. Hybrids are grafted onto wild rose root stock. If you wish to plant a rose bush, you buy it from a nursery.

If you are looking for Buds, the beer section of any supermarket or carryout will have a good selection.

This Bud's for you....

: I'm looking for some user info on 2M allmode rigs:

: Yaesu FT290
: Tempo VHF 1+

I had a VHF 1+ for a while. Pretty basic FM rig with a connector
covered by a cover. The manual and schematic described a SSB
adapter which I was unable to acquire. It put out ~20 Watts at
12.0 Volts (not 13.8) and was rather deaf by today's standards.
It made a reasonable first VHF rig.

: home and tested it, and it seemed bad too. Being inexperienced on the
: 70 cm band, I'm wondering though if the problems were caused by something
: I was doing.
:
: Symptoms: I can key a local 146.790 (-600) repeater on 446.785 with the
: HTX-404, and hear some locals talking with their 2m rigs on that freq.
: That repeater is only about 1/2 mile from my site, but on Sun., I also
: found I could hear the 147.120 repeater in Canton, from my site in
: Cleveland (distance of about 60 miles) with my HTX-404 on 446.950. In both
: cases the HTX-404 was set for simplex. I must have been transmitting
: on the input, 146.190, of the nearby repeater, and I surely must
: have heard the output of the Canton repeater, since I copied its ID,
: WD8AYE.
:
: I talked simplex to a friend with a 70 cm rig, about 1/4 mile away, on
: 446.000, and things seemed normal with that operation.
:

I have an htx-404 and IMHO it is an excelent rig. The IMHO major
design flaw of the htx-202 (overloading the finals on 13.8v) was
eliminated.

Many 2 meter repeaters have 70 cm inputs and outputs. Some are used for
linking remote sites, some are used to allow access on either band.

Fo example, the W3QV 147.03 (Phil-Mont mobile radio club) uses 444.80
as a link from it's remote sites and allows normal use on 70cm also.

The 2m input is usually not PL'ed (CTCSS tone restritcted), but the
70cm always is. I can't speak for everyone, but all the 70cm repeaters
I know of are PL'ed.

The repeater is open to all licensed hams. It is not a case of PL'ing
to keep people out.

In some areas of high QRM 2 meter repeaters are PL'ed also.
I expect that in the next few years most FM repeaters in the U.S. will
be PL'ed to prevent the wrong repeater being brought up by accident.

Hello all,

I have a Radio Shack HTX-202 2-meter HT. I remember reading on this
newsgroup about some older Icom HT's that had Ni-Cd packs which were
compatible with the Radio Shack models. If anyone has any more info
on the specifics of this battery pack please respond via the group or
e-mail.

Also, I was wondering if anyone else with an HTX-202 has any problem
with the unit getting really HOT when running off the car's cigarette
lighter jack. It supposedly puts out about 6 watts when running
off this power supply, and it does really heat up after about 5 minutes
of talking time. Any and all comments on this matter would be appreciated.

Hi Anil, Most "high power" HT's run so hot they're hard to hold. My DJ-580 gets so hot on 440 MHz high power that I can't hold it bare-handed. Check your SWR and if it's close to 1/1 and putting out 6 watts then it's probably functioning normally. I tend to run mine on medium power because of the heating problem. You might consider a linear amp or a real 5w/50w mobile rig.

FYI, for those who were on the previous R-7 thread, Mike is the fellow
who first told me about the R-7/trap problem. Please note that the R-5,
which is very similar to the R-7 except for lacking 30/40 meters (and
having better bandwidth on 20 meters) has none of the above problems.
The R-5 is a real trooper.

Mike Deignan, please note that it is not just the 40 meter traps which blow.

Don't know why.

I use some heavy duty velcro from Radio Shack. It is made of plastic. I
actually have it holding up my TM732A mobile which is stuck to the metal wall
behind the seat on my pickup. This stuff is really strong. I also use it to
hold the control head to the dash. I trimmed off some of the "hooks" because
the stuff is so strong it is hard to separate the two pieces.

I have not originated any mail on this list before, so I apologize in advance for any errors or breaches of etiquette.
I have a collection of service information and literature dating back to the 1920's. I will be happy to assist those needing copies of out-of-copyright information for specific makes and models of receivers and transmitters, test equipment, etc..
The collection spans commercial, amateur and military surplus gear of all types. Unfortunately I have not taken the time to catalog all this information, but it is logically filed by make, model, etc.
If you need service information for a specific piece of equipment, (and I have the information in my collection) I will research and copy it for you. Cost will vary depending on the time required to find the information and the amount of pages to be copied. I estimate 10 pages or less at $1.00/page including US postage. I will quote on larger manuals.
This is NOT my career or a business. Any requests must be prepaid or I will ship COD at additional postage costs.
I can be reached on the Internet at: wpaperman@msmail.his.tch.tme.edu

Does anyone have any comments about the new Icom 2m/440MHz handheld, the
IC-T21A? I am considering purchasing this radio, but I would like to hear
what others think of it. Also, the regular ftp sites don't have extended

transmit mods for this radio, can it be modified for extended transmit?

I am also considering the Yaesu FT-530, which costs about $100 more than the Icom, but I know a lot more people have the 530, and the extended tx mod is available.

Ideal information would be a comparison between the IC-T21A and the Yaesu FT-530.

Thanks, eer

To: ham-equip@ucsd.edu

Niels Jensen (nielsj@sad.hp.com) wrote:

: I just purchased a IC-2GXAT from HRO in Alameda. The sales
: guy told me it was possible to receive over a wider range than
: 144-148 MHz using a keystroke sequence. He didn't know what it was.
: Anybody know or believe this?

: Anybody know of mods that can be made for this radio?

Well, I found out one mod myself:

I called HRO back, and this is what they told me:

1) Turn tranceiver off.

2) Simultaneously hold down the F, SCAN, and DUPLEX keys while
while you turn the radio on.

3) Wider coverage of receive should be enabled.

I did this and it worked! The receive coverage seems to be 50 - 200 MHz. It actually isn't as wide as this; I tried the FM broadcast bands and there was nothing there. I think the actual coverage is 136-174 MHz, since that is what the radio is specified to do, at least in Italy (look in the manual).

I also wonder what else keystroke combinations might do; HRO didn't know or wouldn't say anything about any others. If anyone discovers anything, please post it!

Thanks,

Niels Jensen

Subject: REPAIRS
To: ham-equip@ucsd.edu

I have a Yaesu FT101-E which needs repairs. The problem is this: when I'm transmitting CW, I get reports of my frequency varying up and down. I've been told it could be a bad capacitor in the power supply, or a dirty potentiometer, or all kinds of other stuff.

Please help me, if you can, with either/both of the following:

a. A SIMPLE approach to checking and repairing it myself. (I have only BASIC equipment...no scope, frequency counter, etc.)

or

b. Reliable and reasonably priced sources of repair...hopefully in the Carolinas or the Southeast.

Does Yaesu still repair these old rigs?

Any help would be most appreciated!

Tnx es 73...

Subject: RS 440 Rig, Bad?
To: ham-equip@ucsd.edu

Last Fri. I got a HTX-404, took it home, tested it, and it seemed bad.
On Sat. I took it back, and they got me another one on Sun. I took it
home and tested it, and it seemed bad too. Being inexperienced on the
70 cm band, I'm wondering though if the problems were caused by something
I was doing.

Symptoms: I can key a local 146.790 (-600) repeater on 446.785 with the
HTX-404, and hear some locals talking with their 2m rigs on that freq.
That repeater is only about 1/2 mile from my site, but on Sun., I also
found I could hear the 147.120 repeater in Canton, from my site in
Cleveland (distance of about 60 miles) with my HTX-404 on 446.950. In both
cases the HTX-404 was set for simplex. I must have been transmitting
on the input, 146.190, of the nearby repeater, and I surely must
have heard the output of the Canton repeater, since I copied its ID,
WD8AYE.

I talked simplex to a friend with a 70 cm rig, about 1/4 mile away, on
446.000, and things seemed normal with that operation.

I'm taking the HTX-404 back for a full refund, as I think it must have a
design flaw, but I would be curious to know if there are other possible
explanations of these strange phenomena. -- Phil Emerson, aa8jo.

Before you go and exchange that rig, have you asked anyone else if
they can do the same thing? It is quite possible that these 2m repeaters
have remote bases (possibly undocumented) operating on the 440 band.
If this is the case, you're symptoms would then be a feature,
since you can access 2m repeaters with your 440 rig. From the ARRL
directory, it appears that Ohio only uses the 442-445 subband for
repeaters. That would leave 440-442 and 445-447 open for this kind
of remote basing. Anyone from 8 land know?

My guess is you've stumbled onto link frequencies for those repeaters.
Either that or someone's set up a crossband radio in your area to
repeat from 440 to the 2 meter repeaters.

>>request to SHIP my rig!

You obviously never dealt with any of the Tritons prior to the IV!
You had to sneak up on the VFO to keep it from "pulling" when you
touched the knob.

Or the handy "clean the contacts with an eraser" trick to get you
radio working again.

Even the Triton IV would have a tough time beating some of it's contempories
like the Kenwood 520 for long term reliablility. (Even considering the
Ten-Tec short circuit'able finals.)

When radios went PLL, they could not even start to compete. How long did
it take them to bring out a "modern" (GC rcvr, non-analog) rig? Yes, I
know they finally made their VFO's stable.

I like most of the Ten-Tec gear. But to simply declare all TT gear as
suprior to all Japaneese gear??? Get real.

I have been interested in the TT scout as a "play" rig. Only, they do
not sell through dealers. And they have not attended the Atlanta hamfest
for at least 2 yrs. Kenwood/Yaesu/Icom/Standard/MFG/Kantrionics/Ramsey
were all there) I am supposed to buy one based on a brochure??

Ten-Tec has not changed much since it's inception- Looks interesting,
but usually missing something in the execution. (Maybe this is not true

of the way high end rigs)

I think the original description of "workman like" construction is not
far off. This is not an insult, just an observation. The radios were
pretty straightforward to work on.

Anyway, they all cost too much! :-) (US or imported)

You get 7 characters per memory channel and it's a full ISO8859 character
set as far as I can tell: upper and lower case, all punctuation,
International language accent characters, plus some unusual looking
stuff. The knob inside (above) the right volume control is a "step"
switch that allows you to move up or down in whatever mode you are in.

You also get to program in a 7 character power-on message.

Hey Jim, wanna bet? Here's what you do:

1. Put on some bib overalls and a ballcap that says "My wife - yes, my dog - maybe, my gun - never".
2. Go to 7-11 and buy a can of Skoal. You need to have a big chunk of "tobaccy" under your lower lip.
3. Drive to your local RS store and in your best "I am a CBer" accent start asking a lot of stupid questions about CBs. The stupider the better.

You may have to go to two or three stores, but I am 100% certain that you will find someone who will sell you this rig as a multiband CB.

I echo these comments. We have bought 7 SG-2000 units with smart tuners, whip antennas and power supplies.... and the reliability record has been terrible... we have had multiple radio failures and multiple power supply failures.... one of the power supplies burst into flames when we energized it. Although it is claimed that the 8 foot whip antenna will load up down to 2 MHZ, one of our assigned frequencies is 2.018 MHZ and we have had many many problems getting the units to load up at that frequency... We selected these units because we wanted reliable units with easy operation.... It seems we were wrong....

However, the smart tuners are great........

I'm looking for a review/comments on the ICOM 2700 2m/70cm radio.
I've seen them advertised for months, but don't recall every
seeing an article posted on this radio.

Are you sure you're not hearing the cross-band site on the 440? Many
repeaters here in Md output simultaneously on 2M/70cm.

Many of you non-experienced 440 operators are going to find that you can't
seem to get the same results as on 2M. 440 is a tougher band to operate,
you need to use better cable, better antennas, and have to be aware
of things like foilage on trees in the summer having an effect on 440
propagation. You can also take advantage of multi-path if you use
higher power. Many of you will undoubtedly get frustrated but it's a nice
band to operate and the antennas get easier to work with.

3154. Re: RS HTX-202 help?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-26 19:21:36 UTC
From: palmer@Trade-Zone.msfc.nasa.gov
Message-ID: <313no0$q20@hammer.msfc.nasa.gov>
Source record: 225330

Rapid heating is a common problem with HTs. The HTX-202 isn't nearly as bad as my TH-78A! Based upon my experience, the key to the whole problem is generating adequate air flow across the back of the HT which is used as its heat sink. It actually doesn't take much air flow.

When clipped to a belt, keep the HT outside of any shirts or jackets so that when you walk air flows across it.

In the car, try rigging a harness for the HT using a coat hanger (or sheet metal for those more industrious) so that the HT hangs in front of one of the air vents. This also tends to make it easier to fiddle with while driving. About the worst place for an HT in the car is between your legs, faceup on the seat. It will overheat VERY quickly this way.

At home, in the shack, try rigging a stand with a little muffin fan attached to it. The stand can either be designed to hold the HT or to stand behind it.

If you have a lot more money to throw around a small amp is useful (be careful to buy one designed to operate from HT power levels). It allows you to run your HT on its lower power setting (~2 watts) and get a reasonable (5-10 watts) output. At 2 watts your HT would take considerably longer to heat up. An added bonus is that you could run the HT on high power and get 30-50 watts out when operating from a fringe area.

From: jwc@col.hp.com
Message-ID: <313qrt$8e1@hp-col.col.hp.com>
Source record: 225332

I've tried it out on my AL 560 just see if it works (it does).
There are 2 or 3 couples using our repeaters that regularly usr the DTMF paginging feature.
Another feature that is handy, We have put pl tones on the output of our
repeaters then when the users enable the pl decode function the squelch only opens when the
repeater xmitts. This keeps the intermode frome 152 MHz paging
systems from opening the squelch, which often happens in a metropolitan area.
Most repeaters will not pass DTMF tones unless some arrangement is made
wherein a dtmf code activates that ability. This depends on the controller
used and how the owners set them up.

3159. Schematic for MIZUHO or "AEA DX HANDY" needed

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-26 21:47:58 UTC
From: dgf@netcom.com
Message-ID: <dgfCtKHvy.Jvz@netcom.com>
Source record: 225337

I've ended up with a MIZUHO 20M HT (yes, it is a HT for 20M, SSB & CW, etc.)
but didn't get a schematic. Does anyone have a schematic or docs containing
schematic for this unit? Lacking a MIZUHO 20M schematic specifically, AEA
imported the 10M and 6M versions of these I believe as "AEA DX HANDY" and
I suspect the schematic would be close enough for general use.

Much thanx!

73 Dave WB0GAZ dgf@netcom.com

Yes, absolutely a silly price for a single band rig. I don't know what
possessed Kenwood to come up with that price.

> FT-530.

For what reason should the extended tx mod be needed? Surely the rig
is not "type-approved" for use on non-amateur bands.

QST did a review of HTs earlier this year and the FT-530 came out best. I
have the IC-W2E which is an excellent rig. I had promised myself the next
Icom rig when it came out...it was a disappointment so I have stuck with
the IC-W2E. Icom seem to have got it wrong for once!

From: <>
Message-ID: <9407262345.AA21177@venus.atkc.com>
Source record: 225335

I find that I cannot hit any repeater which has a tone even
though I can hit every repeater within the same area that does.

1) is there some sort of known bug with the units? It's been
great except for this one problem.

2) is there some sort of trick with setting the tones? I could swear
that I am doing it right. When I hit the keys to show the tone, it
shows up with the right value. 136.5.

Any help for the brain damaged would be appreciated.

>their experiences with HT antennas made by other companies? I have an AEA
>hotrod that I used on my old HT, but it seem too heavy for the little mount
>on the T21A.

My first thought is an AEA Hotrod. It appears to have excellent gain, but
without a BNC you're stuck. I guess you know all that.

Why in the world did Icom not put a BNC connector on this radio? It
doesn't make sense. A rubber duck is not much more than a dummy load, and
suppose you want to use a mag mount mobil. I guess you could call Icom.

I know now I'll never buy one of these things.

3170. Fair Market for IC02AT?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-27 02:12:13 UTC
From: gtupper@monkfish.nosc.mil
Message-ID: <314fpt$7fo@pandora.sdsu.edu>
Source record: 225342

I have just received my tech license and have an oppertunity to purchase and IC02AT (on the net) I am unsure what a fair price would be. The rig sounds pretty good. From what I've been reading ICOM makes some rugged stuff.

I will be looking at the AES catalogue tomorrow for their listed used price, and to see if they have any closeout/demo's avaiable at near the asking price I was quoted.

Any help would be appreciated.

Mine also does that, and I beleive other handhelds also will 'heat' up too.
I remember reading somewhere were it does not recomend running full power
from a full output power source. It is also bad to run any device straight
from the 12v car source. I have lost a scanner that way. I most mobiles and
some newer handhelds can handle to power surges etc that some cars produce.

hope this helps.

The belt clip is NOT a heat sink. I have heard this before, then I took apart
the radio to find out, and it is sunk to the side of the rig.

Hi,

Does any commercial SW receiver have a noise reduction system, like background noise reduction, CW elimination, spikes elimination. And also does anyone have pass band width adjustment. Do all these feature really important for the good reception ? As far as I understand Grundig Satellit 300 is the best commercial receiver, is it much worse than say Kenwood R 3000 ? Is there in the world something better than R 3000 ?

Sincerely,

Victor Blok

3180. FIX FOR YAESU FT101

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-27 12:39:02 UTC
From: ddepew@CHM.TEC.SC.US
Message-ID: <315kh6$n8t@ns.sunbelt.net>
Source record: 225355

A few days ago I posted a query about up-and-down transmitter drift with a Yaesu FT101. Thanks to all who responded with suggestions. Last night, before putting the rig in box to ship away to Yaesu in Calif., I decided to use contact cleaner on two pots that MIGHT affect xmit frequency. These are located together near the back center section of the rig (under the top cover) and control T/R Zero (actually adjusting the xmit frequency to coincide exactly with receive), and "Volt" - which controls a highly regulated 6-volt power supply in the VFO circuit. Turned out that the second pot was dirty--I checked the signal on another receiver and then went on to have a one-hour CW ragchew with very stable sig repts on the other end.

Hope this helps some of you FT101 folks out there. These pots are located close to the outside of the rig and I guess dust, grease, etc., just build up on them over time.

Tnx agn es 73

I do not have this HT, but from the ad, Kenwood seems to have put the
manual into firmware, with a two-line dot-matrix alpha-numeric display.

They also seem to have taken out the phone-style keypad :(

Not sure what else they've done with it.

I recently (about two hours ago) purchase a Kenwood TH-79A and was wondering anyone has any mods for the radio. Also the radio is quite niffty but it does seem to lack one ?major? feature. That being the ability to lock memory channels out of the scan. Another words if you scan the memory channels you have to scan everyone that is entered in to memory you can't lock out one channel (ie. Weather Channel). Has anyone heard anything about Kenwood adding this feature.

TNX de KA1WIG,
Gregory R. Snow

Get the specs and who makes cable ,there are a number of 9913 equiv.. I have not seen anything posted on Times Microwave System cable LMR-400(the old name was Times Wire and Cable,they have been around since late forties). To me this cable is better than 9913 it has same loss characteristics but comes with weather resistant polyethylene jacket and integral vapor seal. The LMR-400 also has a foam dielectric so water will not condense inside. The dimensions are same as 9913 and 9913 connector will work. The reason I beleive it cost less is that it uses a copper plated center conductor. Here on west coast LMR-400 is sold by Talley Electronics at $0.45/ foot at 500ft and above. QST has add from Cable X-perts but they want about $0.62/ft for LMR400. There is also a LMR-600 with loss of 1.7db at 100ft but needs special connector at $25.00 each. I do not have any interest or work for above companies, only a satisfied customer.

```

I may be wrong, but I interpreted the stickyness problem
to be in the glue of the piece attached to the dash.. in which
case I would suggest lightly sanding (at least not armor-alling)
the area where you are trying to get it to stay. I too use
Radio Shack "hook and loop" tape, but I don't know if it's
heavy duty. Of course, it's only holding a Pro34 vertically
which might not put too much stress on the hold.

Remember the golden rule of velcro, the more area covered on
both surfaces, the better the hold.

|> and delicate. I don't mind carrying a brick as long as it works.

There are a lot of people out here in the LA area who feel the same way.
They just buy the commercial bricks and retune them to the ham bands.
Of course, this means a single-band radio costs around $1,200, but you can
pound nails with them. Bendix King, Motorola Sabre or MX-300 or MX-330,
those seem to be the radios of choice. The Bendix can be retuned via the
keypad by the owner, but the Motorolas have to be hooked up to a PC
running special Motorola software in order to be reprogrammed.

Wow, Greg... You're probably one of the first to own this model radio and you think that there are mods out for it already?? <grin>

> Also the radio is quite
> niffty but it does seem to lack one ?major? feature. That being the
> ability to lock memory channels out of the scan. Another words if you
> scan the memory channels you have to scan everyone that is entered in to
> memory you can't lock out one channel (ie. Weather Channel). Has anyone
> heard anything about Kenwood adding this feature.

If this is true, this is one MAJOR oversight on the part of Kenwood. Something as basic as this would be very bad to overlook.

So, any other first impressions? I read on the net that there may be no telephone style keypad... Is this true?

>spending more for a better HT.

Dear Greg:
The RS HT's are OK, but if you are willing to pay for more quality and power,
consider Icom's IC2GXAT at $300 or the Kenwood TH-22AT. They are much
more sophisticated, offer more features, and will give you more more
wattage with the right battery to get you out of a deep woods situation.

I'm looking for plotter pens and any sort of manual for a Toshiba
HS-P570 plotter printer. I'm told by Toshiba Australia that this
plotter was last sold more than 7 years ago. The division that sold
this plotter was shut down 5 years ago. The remnants of that division
were sold, and the company that bought it referred me back to Toshiba
for support on this device, since it predates their purchase.

Hello,

Over the weekend, I bought a new Motorola speaker microphone for
$5 at a ham swap meet. I would like to convert it for use on my ICOM 2SRA
and am wondering if anyone has converted one of these. The model number is
NMN6125A and it's a real nifty speaker mike with the element on top rather
than on the face. It is rather large compared to many of the commercially
available ones, but appears to be bulletproof. The connector has 5 pins
and if all else fails, I'll dig into it with a meter. Thanks in advance for
any information you could share...

: | Dave Hartzell | DHARTZELL@INS.INFONET.NET |

Well, you're right. I can't find in the manual where it states that the
belt clip is considered a heat sink. However, if the entire case is
getting hot, it seems that the clip may help to radiate the heat away
from the radio. Maybe not, but I doubt that it would hurt.

I have been very happy with my FT-411E. It has performed flawlessly. It is a great solid small unit. My only gripe is that it doesn't have a keyboard protector like the Kenwoods. I have to keep it in its case which makes it kind of hard to press the keys(you do it through the transparent plastic).

It also works great on the public service bands.(receive-only, of course).

>
>Does anyone EVER use the fancy tone calling and paging features on these
>HT's. I justr read and tried to digest my FT-530 manual.

IMO, the presence of the capability is a "MORE Bells, MORE Whistles"
mentality than any practical analysis of need. But then, if they
weren't on the radio, we might never have considered this...

Several of us who do the bike-tour-support-comms thang have considered
using the paging features to alert segments of the group who try very
hard to remain incommunicado . Hams (without headsets - tsk,tsk) shadowing
certain officials from the served agency are frequently asked to
"keep the noise down", so in deference to their charges they sometimes
lower the volume and miss calls. We tinkered with the idea of
electronically grouping these people and banging out a "group page"
if there was not a response in a reasonable time. (Many of these people
also have cell phones, but even here in The Corridor, there are
dead spots.)

Using the paging tones assumes much, however:
a) Shadows must have the page capability, and know how to use it.
b) The repeater(s) in use must pass the tones. This MAY present a
problem as SOME repeater groups are less than thrilled about even
turning off the PL(r) for the day. (NOTE WELL that it is not so much
the group as a whole, but a small contingent of club members who are
annoyed at these "outsiders" who show up once or twice a year and,
how dare we, "monopolize" their repeater.)
c) If you've ever shadowed officials in any event, some VERY quickly
take you and your information passing capabilities for granted, and
don't necessarily respond immediately no matter how much noise you make,
so paging will alert your ham but not necessarily make your official more
responsive. But then, that's not our responsibility; we move data. :{)

Suffice it to say, the whole paging idea is still in the "What if.." mode.

I also heard it has a built-in TNC, can work as a repeater, and with the
optional $1.99 guidance system, can be deployed as a fully functional
satellite! ($1,985,999,000 launch system not included)

Sounds like a ripoff to me. They could at least throw in a lifetime supply
of RG-213 and PL-259s...

The question is whether you heard it independently of my posting of the same rumor a few weeks ago. Is it just my posting (based on info from a local RS saleman) making the rounds, or did your info come from a different source?

ok, i just talked to radio shack in texas. their people say that this
rumor made the rounds on compuserve a little while ago ... it is *not*
true. they have no plans for any transceivers ... they are bringing out a
vox headset and a ht to 30w brick. thee is also discussion about a dual
band ht, but nothing in the works right now.

Okay, when someone said that they'd offer a 100 watt HF rig for $300, I thought "Yowser!"... BUT, it's possible I suppose...

However, a 20-amp power supply for $20!?!!?!?!?!?

No way.

Please note that I'm not ragging on you, just the prices and wherever the rumor started... Amazing.

I wouldn't mind seeing Radio Shack do an HF rig, though, as long as it's not marketed as a multi-band CB like some fear...

3232. Timewave DSP9+ review

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-28 18:47:42 UTC
From: Tom WB7ASR <tom_boza@ccm.hf.intel.com>
Message-ID: <318upn$9t5@chnews.intel.com>
Source record: 225229
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc,rec.ham-radio.misc

I purchased a used Timewave DSP9+ at the Flagstaff, Arizona hamfest for $125 last weekend. Its a 16-bit A/D audio filter, with a 2 watt audio AF amplifier. It does work like the book says, however there are several quirks.

1) When using it to receive 6KHz wide AM short-wave broadcast stations, it narrows the audio pass band down to 3Khz. This makes the audio sound tiny. With the filter in line, 3Khz is the max wide pass band it will produce. However it does a "GREAT" job in eliminating heterodynes, and I mean GREAT !!!

2) When in the 100 Hz CW mode, it has ringing. I was real surprised to hear ringing with a DSP filter. It make the 100 Hz mode useless.

All-in-all, its a good filter for CW and DATA.

Above comments are my own.

I would think the protocol and hardware documentation neccessary to do
your own programming of the Motorola is available on the net somewhere.
There is all sorts of stuff on hacking cellular phones. I can't
see business band radio programming as being that difficult
to implement in home hardware. I also can't see it as so
guarded a Motorola secret that it hasn't been done yet.

Any opinions??

And just think, since this is a "NEW!" item, you can use the 10% off
coupon from the RS catalog! So the radio's only $269.99, and the power
supply's just $8.99.

Keep in mind that the T21A is only a dual band RECIEVING radio. It
does not transmit on 440. The T41A does not transmit on 2M.... :)

Other than that it is a great radio somewhat ruined by a SMA antenna
connector, although with some scrounging connectors can be found.

The stock duck sucks.

This is in response to the recent posting requesting recommendations
for good 2 meter units for neophytes. Still being wet behind the
ears, I can relate.

Personally, my wife and I have had pretty good luck with the Radio
Shack HTX-202.

a) it's cheap, new it costs what other units go for used.

b) it transmits well, with good audio. It even works well for packet.

c) it receives well, with good rejection of unwanted signals,
intermod, etc.

d) it's real cheap if you get it on sale or if you buy it
through rec.radio.swap.

e) with the extended warranty, you're not afraid to let the baby play
with it. If it breaks, they fix it, until 1999.

There are smaller, fancier, with more memories and more
functions, but we didn't need that. People complain that you
can't modify the thing to transmit or receive in the police
bands, but we didn't want to do that either. My wife *LIKED* the
fact that it can't be made to work out of band. It makes her
feel more secure. If I wanted a scanner, I would have bought one.

DAVID_SAMPSON@QM.IS.LMSC.LOCKHEED.COM (David L. Sampson) writes:

I have had many mobile 2m/440 rigs... all Kenwood until I bought my Yaesu FT5100. It's a great rig.. easy to use, sounds good etc.

Be careful of everything on the mike.. if that sucker breaks, then what? I had an old Azden 2m rig like that.. the mike was big and clunky, when it broke I had a devil of a time getting another. Finally put in a new mike plug and a 'regular' mike and used the knobs on the radio from then on.

73 and good luck.. each to his own taste, go try a few in a store (if you can) or with other hams... I still like the Kenwood sound, but I also like my Yaesu!

From: w4qo@peach.america.net
Message-ID: <w4qo.775450848@atl1>
Source record: 225214

I have a VU-DATA scope which recently developed a bug. It is a model number PS950S and is called a mini scope although it is about 4x8x16. I sure could use a copy of the schematic or the whole manual. I have seen it advertised in Nuts and Volts one time but could not find that issue again. It is a discrete component 100 Mhz scope so it should not be too difficult to fix. The CRT appears to be good, but no deflection.

Will pay for copying and shipping, or reasonable commercial prices. Thanks for any leads.

OOOH, the space modulator is a good, solid bonus, but I still won't get it
unless it has capabilities for transmitting and receiving on Channel 9 for
emergencies ;)

Neils:

I own an ICw21AT. I am thinking about buying the IC2GXAT for backup. I got the keypad mod for the 21AT and it works fine - really opened up the receive capability. I called Icom and they said that the 2GXAT has a similar keypad mod. Call them at 206/454-7619. They'll send it to you free in the mail.

The crystal element in the Turner J454-X microphone for my T-T Omni-D failed yesterday;

What's the approximate impedance of this kind of element?

Would it be easier to retrofit the microphone with a modern element than to find a replacement - and if so, with what?

- I would rather not chuck the thing wholesale; it's got style.

> but the 20a supply for $19.99??? i don't think so. they sell supplies now for
> more than that unless it's going to be a recycled die hard! ;-)

I heard its not going to be a 20 amp supply. The transceiver is only going to
draw 1.5 amps (for a 150 watt output), so they are throwing in a 3 amp supply
for free. And the whole radio, with supply attached, will fit into roughly a
2 inch cube. And ;-) back at ya!

David KD4RMW
davidm@iglou.com

P.S. I forgot to mention, the supply also has the option of being run off a
9 volt battery...

What we have got here is a Catch 22(0). Nobody uses 220 because there is no equipment for it and nobody makes equipment for it because nobody uses it. Except for major metro areas, 220 is practically unused, but the pressure for spectrum sees it over-crowded in the major metro areas. The other big reason manufacturers don't make 220 equipment is that the US is the ONLY country where hams are on 220 and since the market is so limited for 220 radios, it just isn't feasable to manufacture them.

Don't go looking for commercial equipment to be coming available any time soon and when it does, it will be pretty low power stuff and possibly some pretty esoteric operating modes.

I hear there's already some mods available for the new Radio
Shack HF rig:

- Given that it's an RS unit, mod to automatically send last 4 digits
of your phone number along with your callsign on CW.

- Mod to use RS rabbit-ears antenna with the fake plastic microwave
dish that rotates with knob to act as antenna tuner.
Set it on top of unit.

- Mod to make frequency digits display "rdYo shAK" whenever you attempt
to Xmit outside ham bands.

- Unit already has nice firmware help like Kenwood TH-79A. Special
mod scrambles help data so it's just like walking into a real
Radio Shack.

- Mod to allow Radio Shack neon phone to act as DTMF unit.

Gee, I hope they don't stop sending me their RS President's sale
catalog each year for this.

Oops, almost forgot the smiley faces for any RS employee that
happens to be listening.

:-) :-) :-)

Ah yes...the R1. The radio you love to hate. I've had one in daily use for about a year now. Bought it used for $165 from some chap who thought that the worn out numbers on the keypad would hamper my enjoyment, and thus he set the price accordingly. The only thing (IMHO) it has going for it is the size and the tuning knob. Otherwise it rather sucks as a receiver. Of course, I do pick up foreign broadcasts in the SW band with just the stock duckie when conditions are ok... a nice plus over the typical scanner. My friend, also an R1 owner, just sold his out of frustration in favor of a PRO-43. I am so tempted to do the same, but I just can't imagine parting with mine. Guess I have a soft spot for the underdog.

I agree with Alan's comments and, though I'm not exactly sorry that
I bought an R-1, I'm working on it. Mine has an intermittent hearing
problem (i.e., goes deaf) in addition to the other problems that he
mentioned. The size is real appealing, but in the case of my R-1,
the performance is lacking and the annoyance factor is high. I'd
keep looking (PRO-43?)

: in stores August 15. Optional 20-amp supply, $19.99."

The prices are unrealistically low.

However, I have long believed that it should be possible to make a simple SSB/CW transceiver for a lot less than the $1000 or so that the cheapest current radios sell for. Leave out the synthesizer, microprocessor, and other bells and whistles and design the solid-state equivalent of the old Heathkit SB-102. I bet it could be done for under $500.

The question is would anyone buy it? Seems like bells and whistles are what sell these days.

Also, it seems like you should be able to make a 200W 12V switching power supply for not much more than a 200W computer supply costs. It would be lower volume and would require more noise filtering, but it would only need a single output voltage.

Recently I have been told that the Alinco DJ-580 handheld can be remotely controlled using DTMF sequences when in crossband repeater mode. Among others you supposedly can change frequencies. Anybody has information on this? DTMF code sequences?

Many thanks in advance. Please reply by mail; I will post a summary if there is enough interest.

I think SB102 might be more expensive to make now than a computerized
radio. Imagine using good-size coils with high Q, good switches,
adjustments, good dial without backlash... For a switching power
supply, I still remember one from Yaesu. It was filtered extensively
yet the noise was excessive for in-house antennas.

Another point is what part of the pricing are advertisements and
dealers? Anyway, labor probably costs more than components.

3278. Hum on Kenwood TM-733A Tx audio

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-29 22:10:24 UTC
From: depolo@eniac.seas.upenn.edu
Message-ID: <31buog$pq5@netnews.upenn.edu>
Source record: 225241

There are three users on our UHF repeater system that have recently bought Kenwood TM-733A's locally. All of them have a hum that appears on the audio when they encode PL. It's not the PL being heard, it's a hum at a different frequency (maybe around 200 or 250 Hz, guesstimate). Anyway, it appears to be a chronic problem with 733's. The local ham emporium is giving these people some song and dance about how "Kenwood intentionally set the PL deviation high on the 733's for those people that use them on commercial repeaters." Major load of BS. First off, "commercial repeaters" are no different from ham repeaters that use PL. For the most part, "ham repeaters" are the same as "commercial repeaters" - they're typically Motorola/GE/Johnson/whatever, and having worked on all of them, I can say that the PL specs are pretty much identical on all of them - 750 Hz is the nominal PL deviation value, with 500 and 1000 being the limits. Second, TM-733A users shouldn't be using their rigs on commercial frequencies - it isn't a type accepted radio.

Someone else mentioned that Kenwood knows about this problem, and will fix it free of charge if you send the radio back. Anyone have a similiar experience with the hum, and was it cured properly by Kenwood?

Well, if you stop to think of it, one of the reasons the Japanese
manufacturers have been able to build lots of HF and VHF gear is
because they are shipping to worldwide markets. The Japanese
domestic market has 1,000,000 operators licensed and about half
that number of station license holders. So, it is arguably the
largest ham market in the world, right? Ah.......but in Japan,
the 220 MHz band is used by commercial TV broadcasting ..... so,
there is no 220 MHz ham band there. I believe the same "may" be
true for some European markets (i.e. Sweden?).

So, without a huge market demand for 220MHz gear outside of
Japan (i.e. the USA), I wouldn't look for much more in the way
of new gear coming from Y/K/I (IMHO).

I'm not real fond of this oversight either. I would *like* to see the
memorys organized into "pages" where I could scan one or more groups of
channels. (in case anyone who can do something about it is listening!)

>So, any other first impressions? I read on the net that there may be no
>telephone style keypad... Is this true?

It looks like a telephone pad to me. Keys up the autopatch just fine too.

I like mine quite a bit. It's quite small even with the 900mh battery
that allows 5W xmit power.

That would be a real nice feature. I like to listen to what VHF services I can
with my TH-215a. I only wish it had more memories than just 10. I guess I'm
going to have to break down and buy one of the newer dual banders with the
mega-memories. ;-) Even though the new TH-79 has all the nice user menus and
stuff, not having the memory lock out would probably keep me from getting it
considering the VHF listening I sometimes like to do. Oh well.

FWIW, I liked all my Hallicrafters gear. But I own those receivers no
more. The SX-111 was a pretty good radio. Ham bands only, and too old to
have the 10, 18 and 24 mhz Amateur bands included.
If I could get one today for a decent (cheap) price, I'd buy one.

I don't think kenwood overlooked the lockout feature for scanning. In their info sheet on the HT, the scanning channel lockout was printed. Later Kenwood sent a mod sheet for their info sheets to delete that line (with a black pen). So it looks like kenwood had every intention of putting that feature in there, but some how it got left out at the last minute. Just thought I'd let you know.

As far as I know, nobody ever got fired for specifying Motorola. Our
sheriff, county PD, OEM, and most of the local PDs, FDs, and FASs have
Big M gear hanging off their hips. You can find the towns using Johnsons
and GE just by listening for the DTMF id's, logos, or whining. :{)

>1st 2meter purchase.E-mail if your so inclined.Thanx in advance!

The TH-22AT has significant intermod problems in urban areas where there
is a lot of RF near to it. Downtown Cleveland is bad. It works well in
the suburbs. The problem downtown is worse if I try to run it through a
mobile antenna. Kenwood suggests using ONLY the rubber duck that comes
with it. I have not used the HT-202 and will let others comment on it.

Anyone who has or has had a Yaesu FT-757GX ever notice that, when
tuning (only w/strong signal present), you can hear a certain
"lack of smoothness" when the number on the display flips?

I guess you'd say it was synthesizer noise, except the synthesizer
changer every 10 Hz (while number flips every hundred). When tuning
slowly, the noise goes away. When using the up/down mic controls,
there's no noise. Actually, sometimes, the noise is STILL there
if you tune slowly, but only at the display-changing transition.

Anyone ever experience this?

A great job with a great company is available for an experienced VHF/UHF systems engineer with extensive experience specifying land mobile radio systems --- base stations, repeaters, trunking. It's a "box" level assignment.

The company deploys such systems throughout the former Soviet Union, through New York and Moscow offices.

Experience in the following regions helpful:

* Motorola experience, two-way; indoor and antenna *
Point-to-multipoint UHF
* Knowledge of vendors and comparative price/benefit of alternative solutions
* Microwave terrestrial and satellite
* Computer skills for presentation to clients & colleagues. *
Internet to AX.25 radio links
* Good health and ability to travel 4 times a year to remote sites in former SU
* Amateur radio license/experience/fanatacism/menatlity a considerable plus

Please state salary requirements in e-mail reply. Company offers full benefits and alot of challenges.

The "Radio Hobbyist's Buyer's Bluebook" by Bob Grove lists this receiver as
$200. Don't know if that's high or low. If you're interested in selling it,
you might want to try the REC.RADIO.SWAP group.

3303. For Sale: TenTec mod 200 VFO

Newsgroup: rec.radio.amateur.equipment
Date: 1994-07-31 19:19:36 UTC
From: jev@tntvax.ntrs.com
Message-ID: <1994Jul31.141936@tntvax>
Source record: 225280

The TEN-TEC Model 200 VFO is a fully solid state unit intended to replace the crystal function in Amateur transmitters operating in the 10 through 80 meter bands. Low drift operation is achieve by using a permeability tuned oscillator with temperature compensated components, a three stage amplifier chain following the oscillator and an all solid state circuit for low overall temperature rise during operation.

Five bands, 10 through 80, are covered, each with a separate dial scale. Vernier tuning with approximately a 25 to 1 ratio permits easy adjustment, quickly and accurately. Multiples of the VFO output frequency are used on the 20, 15, and 10 meter bands; on 80 and 40 meters, the output frequency is used directly. The Amateur segments of each dial scale are denoted as widened lower horizontal baselines and the Novice segments as widened upper baselines.

The VFO is compatible with almost all known amateur transmitters using either grid block or cathode keying, with minor transmitter modifications necessary to insure peak and stable operations in some cases.

Specifications

Band Dial Scale Output Freq.
Band Coverage 80 3.5 to 3.75 3.5 to 3.75
40 7.0 to 7.5 7.0 to 7.5
20 14.0 to 15.0 7.0 to 7.5
15 21.0 to 22.5 7.0 to 7.5
10 28.0 to 30.0 7.0 to 7.5

Load Impedance 80 pF (including cable), 50K ohms or more

Output Voltage 20 v rms on 80, 35 v rms on 40, min.

Keying Modes VFO output may be keyed directly, or with grid block systems, along with the transmitter

Grid Block VFO operates with key line potentials between
Voltages -50 to -150 VDC

Power Source 115 VAC, 60 Hz. (Unit can be converted to 12 VDC)

Controls MAIN TUNING, BAND SWITTCH, MODE SWITCH

Physical HWD, 4-5/8" x 7-1/4" x 7-1/2". Case aluminum
with plastic end panels. Cream and wood grain trim.
3 lb.

After that's all said and done, this is an excellent VFO for a crystal-bound transmitter. I've used it on an Eico 720 and a Knight-kit T-60 with excellent results. Why am I selling it? I finally

found a matching VFO for my Eico 720, the 722 VFO.

Yours for $50 plus shipping, or I'll consider a full or partial trade
for Knight-kit equipment or a General Electric SUPERADIO II or III.

Please send e-mail to JEV@NTRS.COM.

Optoelectronics 3000A Product Review - September 1993
Copyright (c) 93,94 Brian Mork -- "not to make money, but to keep it that way for others."

>>> HISTORY
June 19th of 1993, I distributed a product review of Optoelectronics' 3000A handicounter. It had bad dBm calculations. A 29 July distribution fixed these errors and the text was cleaned up in other ways. More complete input sensitivities were reported. This version includes subsequent perspective after use of OE's M1 handicounter (see the M1 product review of this same date -- it is a pared down version of the 3000A). Damien Thorn (Internet drdamien@delphi.com) wrote a non-technical review article on several of OE's products (covering more why you'd want them and what to do with them once you own them) that appeared in the August 1993 issue of Nuts & Volts.

>>> ABSTRACT
A 10Hz-3GHz feature-laden counter/timer/frequency meter could be a good addition to your shack if you don't have the functionality yet. There are some disallowed configurations that give you less than you may think if you casually read the laundry list of features. Input specifications need more attention or at least acknowledgement of real-life problems.

>>> CONSTRUCTION
The case is an extruded U-channel of aluminum with a flat top plate and end plates. The end plates screw into the U-channel with four screws, one of which is a machine screw. This one is by the A input, apparently designed to provide a better "bite" into an interior copper shielding plate around the A input.

A single 9.2cm x 12.6cm circuit board lies under the faceplate, directly mounting the three buttons and six slide switches, which, in turn, poke through the front plate. A piggyback (piggyfront?) board holds the LCD display. There are two main chips--the OE10 vaulted in Optoelectronics' marketing literature and an SC87C51. My 8751 is labeled M1.3000A 5.20.93 VER 2.1 with a little sticky label. The two main chips and a transformer on the board have a white chalky substance around them as if they were hand soldered and the flux vapors weren't cleaned off. Hope it doesn't corrode. Probably 200 additional components, mostly surface mounted, also occupy the circuit board.

The six batteries are stuck to the back shell (double sided tape?). The two battery wires terminate on the circuit board with a separable connector. The batteries' weight and the solid aluminum case give the unit a solid feel. Neither the wall-wart charging unit or the 3000A itself have

a charging light. For the extra resistor and LED, I would like one. Too many times I've had some master switch, wall switch or loose plug inadvertently negate my effort to charge batteries. And when do you find out? When you needed the unit to be charged.

There are three plastic sheets stuck on the external top and face of the unit. My top piece was peeling off slightly. The front bottom one was crooked enough to let Button 2 not bounce back up. Slight trimming fixed that. I can't tell if the white lettering is applied on top of the plastic or behind the plastic. I hope it's behind so that they don't wear off. All the aluminum is painted black --not drippy, but it has the appearance of thick enamel. Personally, I would much rather have black anodized so there would be no possibility of chipping paint.

>>> OWNER'S MANUAL
It's five sheets of photocopied 8-1/2" x 11", printed in landscape mode and folded in half. It's short, but operation of the 3000A is easy, so maybe a lot isn't needed. I would propose inclusion of a few diagrams and tables rather than all linear text description. Included in the manual are:

Features description..... 2 pages
Specifications..... 1 page
Operation..... 2 pages
Data Interface..... 2 pages
Block schematic..... 2 pages
Operation hints..... 4 pages
Battery & Power..... 1 page
Calibration..... 1 page
Warrantee..... 1 page
Service & Return..... 1 page

A loose sheet of paper describes how to turn on the backlight option.

I wanted to know what I could plug into this meter. Nowhere in the specs or owner's manual are the max input ratings. After talking with the factory (toll call is small compared to the purchase price, but still is annoying), I find the 1 Mohm inputs can handle a maximum on the order of 50 volts AC+DC. The Model 3000 (not the 3000A) specified 100V RMS as the maximum. Anyhow, I feel good about plugging in TTL.

DON'T plug TTL into the inputs if the 50 ohm switch is selected! More subtly, be sure you *unplug* it before you slide the switch to the 50 ohm position. The same phone call revealed that the 50 ohm inputs handle a maximum of +15 dBm. That's 1.2 volts RMS in a 50-ohm system, corresponding to 3.4 volts Peak-to-Peak if the waveform is a sine wave. Another user was told by a factory technician that "a 5W HT connected to the counter input for a short time would not damage the counter." Five watts is about +37 dBm! Does the amount of time matter? The correct numbers need to be in an Owner's Manual, especially since the warranty excludes "damage to the input circuitry from the application of an excessive input signal."

I would suggest making no direct electrical connections to the 50 ohm amps. Only antenna type inputs should be used when the 50 ohm amps are selected. I've wrapped an 8" wire (snake like) around cordless phone antennas, and that works ok, but even this would be *way* to much for a 100W HF transmitter. Be careful. Full scale bar graph ranges from 2 - 4 mV, depending on the frequency. If you stay on scale, you're safe, but most of the valid input window is above "full scale." In the range 4 mV to approximately 1200 mV, you'll be increasing power "in the blind."

>>> OPERATION
Some non-obvious combinations of functions and inputs is the order of the day. This is kind of weird, but is intentional to give you the best sensitivity possible, using a number of specialized input amps.

Turn it on, holding down a Button 2 if you want the optional backlight to come on. Button 3 selects the gate time (resolution). With a slide switch, you select either 1 Mohm (Hi-Z) or 50 ohm (Lo-Z) amplifiers.

If you select Hi-Z inputs, Button 1 selects either/both A and B inputs. Button 2 rotates between FREQUENCY, PERIOD, INTERVAL, and RATIO. Input A measures only 10Hz - 50MHz, with sensitivity of a few tens of millivolts. Input B measures only 10Hz - 10MHz, with a sensitivity of better than ten millivolts.

If you select Lo-Z inputs, a signal strength bar-graph indication automatically appears and you must select one of three input amps:

Input A only, from 10MHz - 220MHz (0.3 to 5mV sensitivity)
Input A only, from 10MHz - 880MHz (divide by 4 prescaler)
Input B only, from 500MHz - 3000MHz (new amp, div by 16 prescaler)

On one of OE's product literature flyers, they speak of a 1-200MHz input. A phone call confirmed that this range exists only as a typo on the product literature flyer.

In parallel with all the above input selections, two switches let you operate in either of four modes. I'll call them modes 00, 01, 10, and 11, representing whether FILTER and CAPTURE, respectively, are off (0) or on (1).

00 (FILTER off, CAPTURE off) Operates as described above. This is the single mode of the original Model 3000. Meter shows updated values even if it's counting noise. Gate light blinks continuously.

10 (FILTER on, CAPTURE off) PERIOD, INTERVAL and RATIO are disabled. Computer logic looks for meaningful oscillations, providing a new frequency value only if a legitimate count is acquired. A higher level of filtering can be selected by holding down Button 3 during power up.

11 (FILTER on, CAPTURE on) Same as mode 10 except nothing happens until you arm the system by pressing Button 2. Once you do this, the word "frequency" flashes on the display until a legitimate

count is snagged. A three-memory buffer (the display plus two more) keeps previous values. They are referred to as X, A, and B. X contains the most recent, A the second most recent, and B the third most recent. When a fourth value is snagged, the value in B is lost.

01 (FILTER off, CAPTURE on) In this mode, no measurements are taken. Button 2 rotates between the three memories recorded in mode 11.

>>> PRODUCT SUPPORT
In some sense, there's not much to support. The meter either works or it doesn't. Operation is very straight forward. I don't call to harass service personnel and I *do* read the manuals first. I did call to find out about the input characteristics as discussed above and was, well, not impressed.

Female answers and I ask for service or tech help. After 2 minutes, the line drops dead. I call back. Same female passes me on to Ray quickly this time. I ask Ray about input specs. He says that, yes indeed, that has been inadvertently left out of the manual. Stand by. Three minutes. Ray comes back with info. The 1 Mohm inputs are "plus 50 volt AC plus DC", the 50 ohm inputs are "plus 15 dBm." Yes, that's what I wanted! Follow up: What do you mean by 50v AC+DC?" Hmmm. He didn't know; that's what the engineer told him. Ok. Is it capacitively coupled? Uhh.. the inputs go right into a "MAR6 amplifier." Could you please send me a copy of just the front end prior to the MAR6 amps? Pause... "Well, there's a capacitor that goes to ground." Yes, that's the kind of info I want. What size? Maybe a pf or two? "It's a 50v electrolytic." Eeee wrong person. Would he send me just a copy of the front end schematic? "No, we don't have anything like that I could send you." Ok, well thanks anyhow. Bye.

In retrospect, I should have asked for the engineer who was sourcing this information. Inputs are listed in the specifications as 1MHz, 30pf. This seems believable since it mimics a normal oscilloscope input. But are they AC or DC coupled? With what size, type & rating capacitor? I was hoping to use the INTERVAL or RATIO mode with Input B held open so I can count events on Input A. At Dayton a year back, I spoke with a man named Bill Owens who seemed to have a good handle on the company's history and the capability of the product line. I wish his knowledge was conveyed better to potential buyers.

>>> REAL LIFE
I have two regimes of interest for which I want this counter. The first is modem and ultrasonic work in the KHz to 100 KHz range. The second is radio VFO work, requiring MHz up to GHz. I characterized the 3000A with a 20Hz - 1MHz function generator, my Yaesu 757GX/Vectronics VC300DLP combo, and a Hewlett-Packard VHF/UHF generator.

--- low frequency ---
For the less than 1MHz work, the Hi-Z inputs are used. I have a 1MHz TXCO standard in my shack that has an output floating on the back side of

a little toroid transformer. It gives out approximately +-0.5v into my 500 Kohm load (3000A and oscilloscope in parallel). My 1MHz output shows up as a stable 6.00 Mhz on the 3000A. What?! Yes. Regardless of the filter selection (none, medium, or full), six megahertz kept being displayed. The waveform was not symmetric, I'll give that much, but it was very stable and clean from other high frequency hash. It looked sort of like this:

```
|\ |\ The waveform stayed the same regardless of
0 V___| -- | -- whether the 3000A was hooked up. The 3000A
| | | | counted the same regardless of whether the
-. .---. o'scope was hooked up. P-P voltage was 1.5v.
```

The 1MHz output from my TXCO was a square wave ranging between 0 and 2 volts. Regardless of the 3000A filter selection, it showed a frequency of 3.0 MHz. Another user working on a homebuilt oscillator also reports extreme sensitivity to harmonics. This harmonic sensitivity, combined with extreme sensitivity makes the instrument virtually useless when using any frequency multiples in your project: you won't know which signal is being locked onto.

I fired up a variable frequency / variable amplitude function generator and o'scope combination. The generator went to the scope with a BNC T-tap half way that plugged into the 3000A.

Using the A input, I needed incredulously large amplitudes--WAY above the specified <20 mV. Using the B input was even worse. The procedure used was to start at about 100 mV and go down first. If a stable count held, I reduced the PP voltage until spuratic readings were obtained. If 100 mV was giving spuratic or known-to-be-wrong numbers, I turned the amplitude up until a stable reading was obtained. The resultant measured PP voltages (asterisks indicate I never was able to get a good count):

Frequency	Input A	Input B
20 Hz	2 V (0.78 VRMS)	*
200 Hz	1 V	*
350 Hz	0.6 V	*
60 KHz	50 mV	4 V
500 KHz	<10 mV	1 V

Square wave counting was similar. For instance, 2 V PP was needed at 10 KHz to get a good count with Input A. In all cases, the scope showed clean signals with no high frequency hash. Testing at another ham's shack who had a fancy HP generator and scope yielded the same results within 10%. Stable operation of the Hi-Z input is mandatory to use the interval and period functions of the 3000A, and this condition does NOT seem to be met. I consider the non-frequency modes to be historical carry-overs from the product lines' 7226 counter heritage rather than useful features of OE's OE10 custom chip.

I own a PK232 radio modem and decided to see if the meter was good enough to tune the audio tones. With full output from the PK232 (about 0.5v PP on the scope, giving 140mV RMS on a Fluke DVM good to 10KHz), I stuck the tones into Input A and Input B with Hi-Z amps selected. The 2200Hz tone showed as 2265+-5Hz (A) and 23KHz (B), respectively. The 1200Hz tone showed as 1820+-15 (A) and 31KHz (B), respectively. No, I did not adjust the PK232.

--- high frequency ---
My RF test goal was simple. How accurate is my 757GX VFO? Working near 10MHz, the Lo-Z A input (only one suitable for this measurement) has an advertised sensitivity of <5mV. With a 12" dangling wire near the coax out the back of the radio, the counter was dominated with a signal at approximately 104 MHz (103.9 FM?). Later tests 25 miles across town again showed that with a wire pigtail antenna, it was being dominated with this station. I bought an RS15-577B FM trap and put it in line. Now a 68 MHz interference dominates, probably the local Channel 4 TV station.

I went back to the Hi-Z inputs. At this point I was trying to determine the electrical length of some coax. A 1/4 wavelength of coax is terminated with a short circuit, and fed in parallel with a 50 ohm load with a mid level RF power (see page 74 of the June 93 QST; the goal is to get a 1:1 SWR). The high current node at the terminator is the point I was trying to pickup RF with the 3000A. Twenty turns of perfboard wire around a pencil stepped up the voltage enough for the meter to register stable counts when the pickup coil was positioned near the end of the coax shorting wire loop.

Characterization of the three 50-ohm amps with an HP generator showed solid frequency locks at these random check points:

Fast Amp	Middle Amp	Slow Amp
800MHz, -47dBm, 1.0mV	100MHz, -65dBm, 0.12mV	150MHz, -60dBm, 0.22mV
1000MHz, -43dBm, 1.6mV	450MHz, -54dBm, 0.45mV	

Attempts to do PERIOD, INTERVAL, and RATIO measurements were unsuccessful due to the skittish behavior of the Hi-Z inputs.

>>> OPTIONS
You can buy a precision (0.2 ppm vs 1.0 ppm) timebase for an extra $100. What used to be a $45 backlight option now seems to be a non-optional extra expense. September advertisements still quote the lower price for the standard model, but the sales personnel won't sell one that way.

--- time base ---
There are two reasons why I did not want to buy the precision time-base option. One is because a RATIO mode is provided and I already have a precision 10MHz TTL oscillator scavenged from an old LORAN navigation board. 10MHz also happens to be the maximum frequency Input B accepted in the ratio mode (all ratios are A/B). What a coincidence. Works for me!

The second reason is simply that the 1ppm timebase is specified to age at a rate of 1ppm/year. A 0.2 ppm option would be degraded to the 1.0ppm option in only about 10 weeks. In any case, I usually don't need to know the last 2 Hz on a 10000000 Hz signal.

--- backlight ---
When it's on, I can hear a switching circuit bringing up a high voltage for the luminescent display. It turns off after 10 seconds of inactivity and comes on again when some button is pressed or frequency is acquired.

It looks good. Worth $45? The native display is plenty readable and the extra light actually makes reading it harder from angles "above" the counter.

>>> GOTCHAS
The serial interface is unidirectional. You send it a CR and it sends back 10 digits and a decimal point, in ASCII, 2400bps, 8 bits, no parity, 1 stop bit. It only works in FREQ mode. It provides only the most recent number, with no indication of whether this is another sample or the same number it just sent you after your last request. The interface can sink 1.6mA and source 0.06 mA.

Excellent amplifier sensitivity isn't everything. Sometimes it's even a burden. For decent counting, the signal you're monitoring must exceed the noise (combination of *all* other RF signals in the bandpass of the selected amp) floor by 10-15dB. Specified sensitivity ranges from -57dBm to -11dBm. The input amp is limited to +15dBm. Ambient noise, including FM stations hovers about -11dBm. Play with those numbers and you'll see that the window for a good count can be pretty small. Try to measure a cordless phone near your transmitter or computer monitor? Probably not. If you live near a broadcast station, good luck. I don't consider these numbers a design flaw given the intentionally wide frequency range of the amps, but it definitely affects your day-to-day operation.

In Damien's review, he emphasizes the importance of a limited bandwidth antenna. Take this recommendation seriously. Wide range frequency coverage means susceptibility to noise. A bandwidth limiting antenna helps mitigate this problem.

>>> SUMMARY
The at-your-door price for a 3.5" x 5" circuit board seems a bit high, but the counter is specified to do what I need it to do, plus a few options. Resolving the skittish Hi-Z input problems is a must. The M1 gets around this by simply not having multifunction capability. Paying the extra $100 for a 3000A with specified capabilities that in real life are marginally usable deserves a second thought.

All models are available only direct from the manufacturer in Florida. Contact Optoelectronics: 5821 NE 14th Avenue, Ft Lauderdale, FL 33334. 800-327-5912 or 305-771-2050. FAX 305-771-2052. Makes you want to dial ..2051 and see who you get, doesn't it? :)

Optoelectronics M1 Product Review - September 1993
Copyright (c) 93,94 Brian Mork -- "not to make money, but to keep it that way for others."

>>> HISTORY
In June of 1993, I distributed a product review of Optoelectronics' 3000A on Packet and Internet networks. It had bad dBm calculations. A July distribution fixed these errors and the text was cleaned up in other ways. More complete input sensitivities were reported. I now have an M1 counter and this review reflects the new experiences. A third version of the 3000A review is distributed concurrently.

>>> ABSTRACT
A 10 Hz - 2.4 GHz frequency meter could be a good addition to your shack if you don't have the functionality yet. The M1 is essentially a pared down version of the 3000A. At many places, this review assumes you have experience with the 3000A or have read that review. The 3000A I owned for a short while was returned because it was too tender and vulnerable to real-life conditions. Since then I've purchased an M1 and intend on keeping it. It is my recommendation to most people.

>>> CONSTRUCTION
The case is an extruded U-channel of aluminum with a flat top plate and end plates. The end plates screw into the U-channel with four screws, one of which is a machine screw. This one is apparently designed to provide a better "bite" into an interior copper shielding plate around the input. The gate LED on the M1 protrudes excessively from the LCD panel, unlike the 3000A LED, which was mounted to the same height as the switches and pushbuttons.

A single 6.5cm x 11.7cm circuit board lies under the faceplate, directly mounting the two buttons and five slide switches, which, in turn, poke through the front plate. A piggyback (piggyfront?) board holds the LCD display. There are two main chips--the OE10 vaulted in Optoelectronics' marketing literature and an SC87C51. The two main chips on the board have a white chalky substance around them as if they were hand soldered and the flux vapors weren't cleaned off. Hope it doesn't corrode. Probably 200 additional components, mostly surface mounted, also occupy the circuit board.

The M1 has four battery cells. Literature claims a recharge lasts about an hour less than the 3000A. My M1 ran for 6:50 on a full charge. The low battery indicators, although functional during the power-on check, never did illuminate during the battery run-down check. The counter just quit counting and a minute or two later the display faded.

A non-technical review of OE's products (covering more why you'd want them and what to do with them once you own them) written by Damien Thorn (Internet drdamien@delphi.com) appeared in the August 1993 issue of Nuts & Volts. He sounds like he enjoys his 3000A. I prefer the M1. The M1 costs $100 less.

>>> OWNER'S MANUAL
It's five sheets of photocopied 8-1/2" x 11", printed in landscape mode and folded in half. It's short, but operation of the M1 is easy, so maybe a lot isn't needed. I would propose inclusion of a few diagrams and tables rather than all linear text description. Included in the manual are:

Features description..... 2 pages
Specifications..... 1 page
Controls..... 2 pages
Data Interface..... 2 pages
Block schematic..... 2 blank pages
Using the Counter..... 4 pages
Battery & Power..... 1 page
Calibration..... 1 page
Warrantee..... 1 page
Service & Return..... 1 page

A loose sheet of paper gives an overall Block schematic.

The max input ratings match the 3000A. The 1 Mohm inputs handle a maximum on the order of 50 volts AC+DC (specified as 100 V RMS in the product literature flyer).

The 50 ohm switches have MUCH less range! Be sure you *unplug* large voltage sources (such as TTL) before you slide the switch to the 50 ohm position. They handle a maximum of "+15dBm or 50 milliwatts". These numbers don't quite match by my calculation (+15dBm is 32 mW). The range corresponds to approximately 1.2 RMS in a 50-ohm system, corresponding to 3.4 volts Peak-to-Peak if the waveform is a sine wave. Accurate numbers need to be available.

I would suggest making no direct electrical connections to the 50 ohm amps. Only antenna type inputs should be used when the 50 ohm amps are selected. I've wrapped an 8" wire (snake like) around cordless phone antennas, and that works ok, but even this would be *way* to much for a 100W HF transmitter. Be careful and use the bargraph. Full scale bar graph ranges from 10-20 mV, depending on the frequency. This covers a large range than the 3000A and seems to cover the range of real-life signals better, but it is less sensitive.

>>> OPERATION
Turn it on, holding down a Button 2 if you want the optional backlight to come on. When the backlight is on, I can hear a switching circuit bringing up a high voltage for the luminescent display. It turns off after 10 seconds of inactivity and comes on again when some button is pressed or

frequency is acquired.

Button 2 selects the gate time (resolution). With a slide switch, you select either 1 Mohm (Hi-Z) or 50 ohm (Lo-Z) amplifiers. The M1 has only one input, and is incapable of period, ratio, and interval measurements.

If you select Hi-Z input, you can count 10Hz - 50MHz, with a claimed sensitivity of a few tens of millivolts, identical to the 3000A Input A.

If you select Lo-Z inputs, a signal strength bar-graph indication automatically appears and you must select one of two input ranges:

10MHz - 200MHz (3 stage amp)
10MHz - 2400MHz (2 stage amp, divide by 64 prescaler)

The M1's 50 ohm input covers the entire range 10-2400 MHz, whereas the 3000A allows selection of 10-220 MHz or 10-800 MHz on the A input and provides 500-3000 MHz on the B input. The M1 has slightly less advertised sensitivity (blank entries imply no published specification):

MHz	M1	3000A
10	5 mV	5 mV
150	0.3 mV	0.3 mV
200	0.45 mV	
400	0.6 mV	
800	3 mV	3 mV
1000	10 mV	1 mV
2000	5 mV	
2400	50 mV	
3000	60 mV	

The M1 bargraph has a full scale reading of 10-20 mV, whereas the 3000A has a full scale reading of 2-4 mV (dependent on frequency in both cases). It has ten RF bandwidth/display resolution combinations (same as the 3000A), but because it has only two RF ranges, each range has more gate time selections. I *still* don't understand what the sense is providing more than 6 digits of resolution with a 1ppm time base. This misleading "resolution" continues to be an Optoelectronics selling point and is inappropriately echoed by others.

In parallel with all the above input selections, two switches let you operate in either of four modes. I'll call them modes 00, 01, 10, and 11, representing whether FILTER and CAPTURE, respectively, are off (0) or on (1).

00 (FILTER off, CAPTURE off) Operates as described above. This is the single mode of the original Model 3000. Meter shows updated values even if it's counting noise. Gate light blinks continuously.

10 (FILTER on, CAPTURE off) Computer logic looks for meaningful oscillations, providing a new frequency value only if a legitimate

count is acquired. A higher level of filtering can be selected by holding down Button 1 during power up.

11 (FILTER on, CAPTURE on) Same as mode 10 except nothing happens until you arm the system by pressing Button 2. Once you do this, the word "frequency" flashes on the display until a legitimate count is snagged. A three-memory buffer (the display plus two more) keeps previous values. They are referred to as X, A, and B. X contains the most recent, A the second most recent, and B the third most recent. When a fourth value is snagged, the value in B is lost.

01 (FILTER off, CAPTURE on) In this mode, no measurements are taken. Button 2 rotates between the three memories recorded in mode 11.

>>> PRODUCT SUPPORT
Optoelectronics employees are professional and are helpful on the business end of things. Raw technical knowledge and, thus, the ability to help diagnose problems or give application suggestions is, in my experience, limited to only one person. See the 3000A product review for details of my experiences.

>>> REAL LIFE
I have two regimes of interest for which I want this counter. The first is modem and ultrasonic work in the KHz to 100KHz range. The second is radio VFO work, requiring MHz up to GHz. I characterized the M1 with a 20 Hz - 1 MHz Heath EUW-27 function generator, my Yaesu 757GX/Vectronics VC300DLP combo, an ADD8000 analog/digital prototype station, a Fluke 8000A DVM, and a Solaritron CD1400 oscilloscope.

--- low frequency ---
For the less than 10MHz work, the Hi-Z inputs must be used. I have a 2 MHz TXCO standard in my shack that has an output floating on the back side of a little toroid transformer. It gives out approximately +-0.8v with an output resistance of 100 ohms. The 2 MHz output shows up as a stable 1.999947 MHz on the M1. The waveform was not symmetric, but it was very stable and clean from other high frequency hash. It looked sort of like this:

```
-. .---. The waveform stayed the same regardless of
| | | whether the M1 was hooked up. The M1
| --. | -- counted the same regardless of whether the
./ ./ o'scope was hooked up. P-P voltage was 1.7v.
```

The 1 MHz TTL tap from the TXCO was a square wave ranging between 0 and 3.8 volts. Regardless of the M1 filter selection, it showed a stable frequency of 0.999974 MHz. These tests came out MUCH better using the M1 than the 3000A.

I next fired up the Heath variable frequency / variable amplitude function generator. I needed large amplitudes--WAY above the specified 10-20 mV. The procedure used was to start at about 1 V and decrease the voltage. If a stable count held, I reduced the PP voltage until spuratic

readings were obtained. The resultant measured PP voltages (asterisks indicate I never was able to get a good count):

Frequency sine square
--------- -------- --------
20 Hz * 35 mV
200 Hz 2.7 V 12 mV
60 KHz 1.8 V 15 mV
500 KHz 70 mV 20 mV

In all cases, the scope showed clean signals with no high frequency hash. For the two lowest frequency square wave measurements, hand placement while adjusting the voltage level significantly affected the required amplitude. Best (lowest) voltages are reported above.

The results for the sine wave signals are about 2x worse than the 3000A Input A response, but incalculably better than the 3000A Input B response. The M1 responded well to square waves whereas the 3000A did not.

I own a PK232 radio modem and decided to see if the meter was good enough to tune the audio tones. With nominal output from the PK232 (130mV RMS on the Fluke, good to 10KHz), I measured the tones with the default digital filtering of the M1 engaged. The 2200Hz tone showed as 2272+-1, the 1200 Hz tone showed as 1278+-9 (14 samples each, standard deviation reported).

--- high frequency ---
My RF test goal was simple. How reliable is measurement of my 757GX VFO? Working at 15 MHz, the Lo-Z input (only one suitable for this measurement) has an advertised sensitivity of 5 mV. I used a scanner antenna, supported about and inch away from a resistor I used as a load. The counter's bargraph was about 3/4 scale deflection from the ambient noise. The transmitter's VFO was allowed to stabilize or about half and hour and then brought to within 5 Hz of WWV's 15 MHz carrier. Transmitting 25 watts into the dummy load resistor, the counter hit full scale bargraph and displayed a frequency of 15.012 MHz. At 100 watts, the M1 displayed 15.001 MHz. Accuracy doesn't look so good under reasonable ham shack conditions, but the M1's 50 ohm input is at least usable whereas the 3000A's was not under similar circumstances.

>>> OPTIONS
You can buy a precision (0.2ppm vs 1.0ppm) timebase for an extra $100. Again, I stayed away from the 0.2 ppm precision timebase because specified aging would quickly degrade me back to the standard 1.0 ppm timebase. Additionally, I don't often need to know the last 2 Hz on a 10000000 Hz signal. As with the 3000A, the electroluminescent backlight is no longer an option-- the standard price is just higher.

>>> GOTCHAS
The serial interface is unidirectional. You send it a CR and it sends back 10 digits and a decimal point, in ASCII, 4800bps, 8 bits, no parity, 1 stop bit. It provides only the most recent number, with no indication

of whether this is another sample or the same number it just sent you after your last request. The interface can sink 1.6mA and source 0.06 mA.

Excellent amplifier sensitivity isn't everything. For decent counting, the signal you're monitoring must exceed the noise (combination of *all* other RF signals in the bandpass of the selected amp) floor by a claimed 10-15 dB. Specified sensitivity ranges from -57dBm to -13dBm. The input amp is limited to +15dBm. Ambient noise, including FM stations hovers about 3/4 scale on the bargraph when using an AR100XLT scanner antenna. Since the scale goes from -56 to -26 dBm, that's roughly a -33 dBm noise floor. Adding in the 15 dB overhead for a good measurement gives -18 dBm required signal. That would be 8 dBm above full scale, roughly 3 bar segments. This matches real life experience of the Yaesu 757GX related above.

The Hi-Z M1 input handles square waves better than sinusoids, whereas the 3000A showed terrible susceptibility to harmonic lock-on with non-sinusoidal waveforms -- both for me and the other friend spoken of above. He was trying to measure a frequency multiplying class C VFO and confusion as to which stage was being measured made the meter unusable. On another project, anywhere near a 50 KHz switching power supply, measurements were dominated by it. He asks "would I have this problem with a TEK or HP counter?" I don't know. I know my extensive experience with a 7226B counter in the 1 to 10 MHz range showed none of the bizarre behavior seen with this (and the 3000A) high sensitivity counter. Triggering of these counters is just erratic. Perhaps a DC trigger with variable threshold adjustment would be better. OE's digital filtering DOES help, but often the filter is fooled or else specified sensitivity is unattainable.

In Damien's review, he emphasizes the importance of a limited bandwidth antenna. Take this recommendation seriously. The M1's bargraph covers the range of real-life, on-the-air signals much better; it actually moves around rather than being saturated most of the time. The required 10-15 dB spread between noise and desired signal appears as 3 to 4 bargraph segments on the 16-segment display. The 3000A and the M1 appear to be optimized to do off-the-air measurements. In this role, using the M1, I've had fun snagging frequencies used by all sorts of Air Force base agencies in a manner just as Damien described. In the lab, using hard-wire connections, the Hi-Z inputs of the M1 don't measure up to specs and the 3000A inputs seem downright unusable.

>>> SUMMARY
Paying $100 less for a M1 balances against having only one input and loosing the extra modes of operation. Because these extra modes relied on the unreliable Hi-Z inputs, I don't miss them. I am extremely interested in hearing reports from others in the field that have success or failure with the M1 and 3000A Hi-Z inputs.

Yes, these prices are unrealistically low. I wonder if he possibly meant
$2999.99 for the rig and $199.99 for the power supply. Or this could be
another bogus rumor flying around. I'm sure everyone has heard about the
dual-band HT, the 2-meter mobile and other paraphenalia Radio Shack is
supposed to have had in the works for the last two years.

Just curious, but have you looked at the TenTec Scout lately? It goes for
about $500 and uses modules for each band. The modules cost about $35 if
memory serves me correctly.

MiniSport Laptop Hacker - Vol #22. July 1994
To discourage pecuniary interests, Copyright (c) 1994 Brian Mork

>>> ADMIN
The MLHacker series is formatted to print out on 8.5"x11" sheets manually fed into an Epson LQ-850. I print at 8 lpi, which gives 82 lines per page. Back issues are available from ftp.cs.buffalo.edu in the \pub\msdos\ham-radio directory. E-mail server ham-server@grafex.cupertino.ca.us also has them in the directory \hamradio\newsletters. Note in the signature block that my packet radio address has changed.

>>> ALTERNATE BATTERY SOURCE
In April Jim forwarded me results of his efforts to modify 9.6 volt Makita power tool batteries. Cut directly from his Internet message, here are his observations (thanks Jim!):

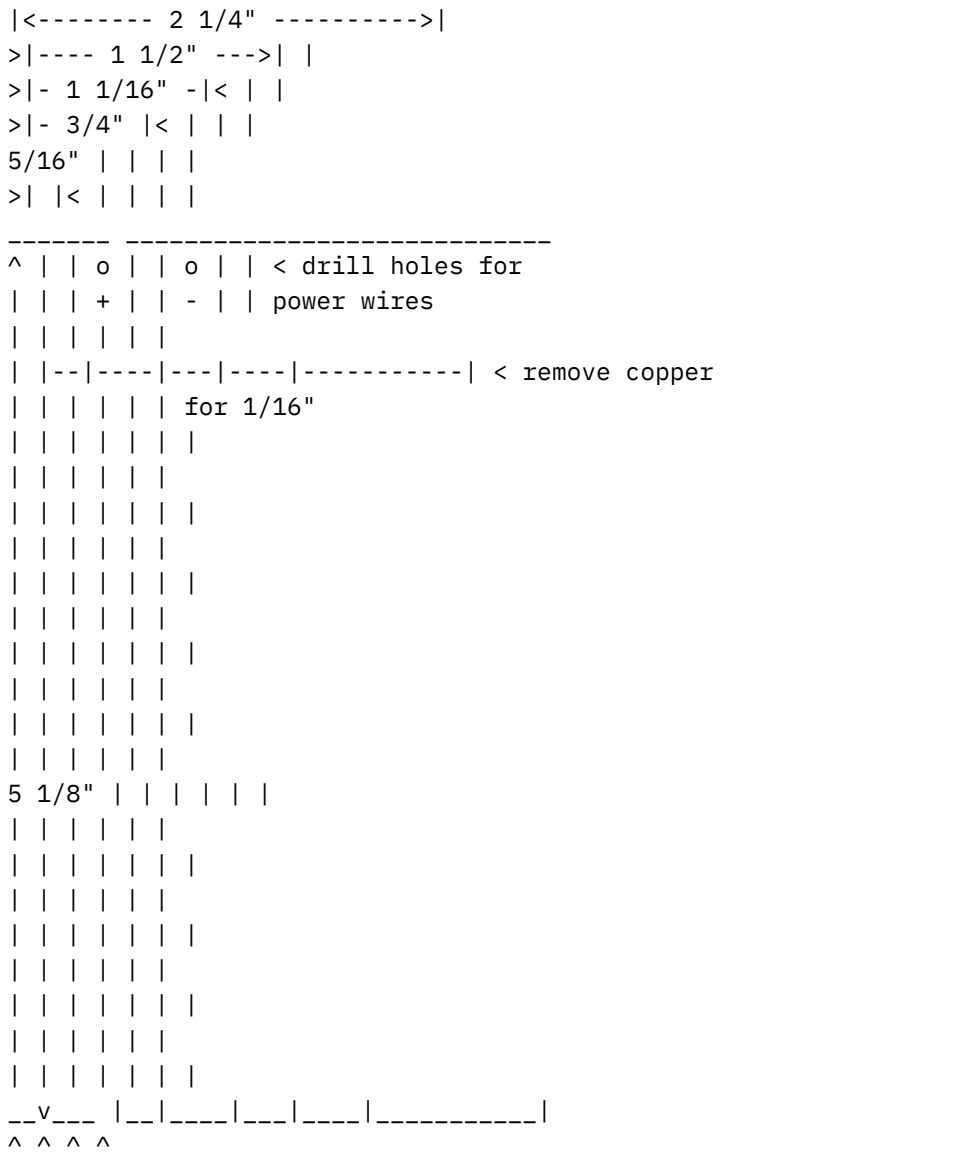
"Just the other day I did something I've been dreading for 6 months. I removed the stock battery from my Zenith ZL-2 Minisport and connected a variable voltage power supply directly to the computer's power terminals. After adjusting the supply to six volts, I powered up the computer and verified that it was working properly. Then, taking a deep breath, I slowly cranked the power up to ten volts. No explosions, no complaints from the Minisport power supplies, It took it just fine. Great, now I can use my 9.6 volt Makita batteries with the laptop as part of my portable packet station.

"Since the internal Zenith supplies are all switchers, current drain is inversely proportional to battery voltage. This means no power is wasted regardless of whether the voltage is 6.0 (stock Minisport battery) or 9.6 volts (as in my Makita pack). I measure 450 - 650 Ma drain with a 6.0 volt source (depending on backlight brightness), but with a 9.6 volt source, only 340 - 425 Ma is needed. The Makita batteries are about 1400 MAh capacity and run my ZL-2 for 3 hours with the backlight on full. Obviously, a 7.2 volt external would work also, with proportionally reduced operating time.

"I had to make a better way to get the external power to the machine than the alligator clips I was using. I thought I'd share what I built with you all. Here's how to make a fake battery pack for your Minisport.

"Begin by cutting a 2 1/4" by 5 1/8" piece of single sided glass epoxy Printed Circuit board material. Remove 1/16" strips of

copper along five lines as shown in the following diagram.



Remove copper along these four lines

"Drill the two holes close to the edge so solder will not interfere with the power contacts on the machine. Only the two small rectangular areas with holes will actually be energized. Isolating these minimizes the possibility of short circuiting the battery. Nevertheless, you should always disconnect the external battery when the fake unit is removed from the computer.

"You can remove strips of copper by double scoring the material 1/16" apart along the indicated lines, then gouging out the metal with a knife or wood chisel. With some patience, you can also do it with a hacksaw or a hand grinder. My favorite method is using a 1/8" drill bit in a small drill press as a router. I raise the table until the PC board is just touching the drill bit. Then one or two thickness of 3 x 5 card under the board

raises the copper just enough so I can route out metal along the lines by moving the board under the bit while it's turning at the highest speed. I have a piece of wood with a vertical fence screwed to one edge that I can "C" clamp to the drill table to help guide the PC board while routing.

"You will need to solder a power cable directly to the board, or glue some sort of jack on the board to accept a power cable through the battery cover hole. The NEGATIVE terminal is nearest the front of the Laptop. The POSITIVE terminal is the rearmost. You won't need a connection to the center terminal, it is used by the Minisport charging circuit. Use a minimum amount of solder and file the solder bumps down smooth.

"Complete the fake battery by gluing a block of wood about 1 inch high to the glass side of the PC board. This takes up the slack in the battery compartment so the board is pressed firmly onto the computer's power terminals. You will have to sand the block to just the right height, or glue on strips of cardboard for extra height if it's too short.

"One problem with using a higher than six volt battery with the Minisport is that the low battery voltage alarm doesn't work. It appears that by the time the 9.6 volt pack is discharged far enough to trip the alarm, it's going down so fast that there isn't time for an indication. Save your work often if you're near drop out time. It should be possible to construct a separate discharge alarm on the fake battery board that will trip at a higher voltage and give a couple of minutes warning.

"I have also created a real battery pack for my Minisport by using one of these routed out PC boards, and hot gluing five "C" size nicads to the top. It works as well as the 1700 MAh Minisport batteries but I have not figured out a way to use the Minisport charger. Also the exposed battery power terminals on the bottom require care to avoid short circuits.

>>> DRIVE EXPANSION PINOUT
On the back of the Minisport is a small plug with a rectangular external form and an internal "D" shape. I have been unable to identify a source for this connector, but several people have asked for the pinout. Here it is, compliments of wa8wzx. The top row of pins 1 through 19 are all sequential odd numbers. The bottom row has pins 2 through 20. Pins 4, 10, 12, 19 & 20 are all ground. Others are:

1 Disk Change 2 Side Select 3 Read Data
5 Write Protect 6 Track 0 7 Index
8 Write Enable 9 Write Data 11 Step
13 Direction Select 14 Drive Select 2
15 RPM 16 Motor On 17-18 Vcc

3311. Wanted - 70cm Antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-01 01:09:40 UTC
From: kb2cq@panix.com
Message-ID: <31heuh$aef@news.panix.com>
Source record: 225283

I'm looking for an inexpensive antenna for use on 448 Mhz. I need the antenna for a 9600 bps packet link. I am within a few miles of the "repeater", so I don't need much gain. In fact, I currently use a rubber duck on a suction cup mounted on the inside of a window facing the right direction. It works well, but the greater gain of a "real" antenna, and being outside in the clear would reduce the ber. Anyone got something sitting in a closet or basement?

73,
Bill

I also am interested, but with one wanted feature - UHF public service band receive (460-470 MHz). I'm a vol firefighter and would very much like to combine my hamming with monitoring the fire/ems channels. An integral duplexor and quadrature radio modem/serial port would all be nice, but not critical. Built-in tone (2-tone sequential) & voice paging decode would be ideal, but I think that I can rig that with an add-on unit.

I would be very interested in finding out if any of the off-the-shelf models can be modified without extensive, warranty-voiding modifications. The ICOM 281 would almost do, if I can convince myself to forego 70cm transmit.

Ken
(ken@mitre.org)
My opinions are mine own.

3316. Wanted - Tower

Newsgroup: rec.radio.amateur.equipment

Source record: 225096

Hi es tnx for reading this,
I have got an ft757gx of my own. That is an very useable small tx. But if my one is just powered on i have got a bit trouble. The trouble is discribed like a jump on working frequency by aboute 600 Hz. When the tx is running a while, that means it is warms up then the jump dos not occur anymore. I think the problem must be caused by the not proper working of the pll-loop. I think it should be possible to repair it by adjust the loop. but unfortunately I have got no manual. I there is someone who can help me out I would be pleased. Of course I will pay the cost for copying and so on. Thanks in advance es 73 de Wolfgang (DL7VWH)

From: papo@briscas.gamekeeper.bellcore.com
Message-ID: <31jg5k$5ao@athos.cc.bellcore.com>
Source record: 225290

... and that's a shame :(. 220Mhz looks like a very nice band
to have nice equipment. That would not only be good for novices but
for the whole Amateur community. In my area (NY/NJ) there are only
two repeaters that I could hit from home on 220Mhz bands.
AFAIK I have not seen any scanners picking up the 220Mhz spectrum.
To make matters worst, the FCC is planning to cut the band in half because
of lack of usage and the manufacturers might not be making the equipment
because they might be waiting for the FCC to split the band in half and
then sell the 220 equipment for big bucks to all their commercial customers.

As my mommy always said: Follow the money.

Message-ID: <gd12-010894133904@gary-domke.cit.cornell.edu>
Source record: 225289

Todd - I have been using an MFJ949D Versatuner II for two years and am very pleased with it. It will handle up to 300 watts, has two coax connections (SO239) and a dummy load. I t also has both a forward and a reverse power meter which also indicate SWR. I am looking to sell it for $75 plus shipping. I do want to sell my HF rig either before or at the same time as the tuner, though. The radio has not as yet sold. The tuner cost me about $150 new. 73, Gary AA2HL

3322. KAM: FM vs. AM detection

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-01 20:38:38 UTC
From: elmore@rap.ucar.edu
Message-ID: <31jmge$1lu@ncar.ucar.edu>
Source record: 225295

A query to those digital experts out there: my KAM has a
button on it allowing me to switch from FM to AM detection. The
manual simply points out that this is what the button does without
further explanation. Doing some *very* simple testing, I find that
the KAM locks onto a tone with a lower SNR in the FM mode; the same
tone at the same SNR is completely ignored in the AM mode.

What is the practical difference bewteen the two? What does
AM detection buy me that FM does not (within the TNC)? I've had the
thing for years and have always wondered about this...

>
> Thanks
>
> Robin

Robin--

There are three things to consider *before* you go out and buy a thru-glass
antenna:

1)Be sure the window is not a 'tinted' or 'privacy' window. Many later model
auto windows are coated with a metallic layer on the inside to reflect light.

Since the 'thru-glass' antenna relies on capacitive coupling of the
transmitted
signal from the inside to the outside, putting a metal conductor between the
plates will likely cause poor performance.

2)Be sure the antenna is mounted as high as possible and that the roof of the
auto is made of metal. Some newer model autos have plastic roofs which could
cause problems for some antennas which require a counterpoise or ground
plane.

3)Thru-glass antennas generally do not exhibit as high gain as some 'bolt-on'
types. This is because thru-glass antennas tend to be shorter to prevent
wind
stress from tearing them off over time.

Suggestion: If you don't want to cut visible holes in your car, try a
trunklid
attached antenna or possibly do what I did... I have a '94 Ford Explorer
that
my wife loves. She has threatened divorce if I cut any visible holes in it.

The solution was to buy an 'L' bracket antenna mount from my local ham supplier
and mount the antenna in the crack between the hood and fender. Three small holes were drilled which only show when the hood is raised. I now have a tallish multiband VHF/UHF antenna mounted that gives great performace, SWR is 1:1 all through both bands, and no visible holes! (My marriage is saved.)

Good luck in your antenna shopping.

Since you bounght the TSP you might want to take the radio back to

Radio Shack and request a new one.

The Renewal alkalines should work just fine. I have been using them

in my HTX-202 alkaline pack for two months now and they work very

well on both transmit and receive. In fact when first charged they

are putting more power into the radio than the ni-cad does.

OK.. No one could verify that rumor.. But, my source (a member of an ultra-secret communications monitoring organization) also reports that the rig is being tested from a location near Fort Worth.. He says that you can find them operating on or near 14.313 mhz.. All operators are supposed to be RS employees engaged in on-the-air tests of the new rig.. Occasionally, other operators will try to break in, but are usually ignored..

One feature of the tests is simultaneous transmissions by at least five stations to emulate bad QRM conditions. Evidently, the test engineers want to make sure that the rig's selectivity and adjacent channnel interference reduction features really do work.

Has anyone heard these tests?

3341. TH-79A

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-02 18:26:20 UTC
From: kilgore@wichita.tivoli.com
Message-ID: <31m34c$iaq@tivoli.tivoli.com>
Source record: 225115

I recently bought a Kenwood TH-79A dual-band HT, and am generally quite pleased with it. My only concern is how hot the case gets after just a few minutes of operation at high power (5 watts) from a 12-volt supply.

It is slightly uncomfortable, but my real concern is the health of the radio. Is the external heat simply a result of the case's heat sink action, or should I be concerned about the state of the radio's internal components, particularly the PA stage? Does anyone know (other than the manual's vague statement about 1 minute on, 3 minutes off) what the safe operational limits for the TH-79A are?

Thanks for any information you can provide. Please e-mail if possible, as my news feed sometimes has problems.

73,
Jeff, KC1MK

: ie : auto +600 in 147 range and auto -600 in 146 range, and

No, it doesn't, you have to select the shift with the "F" + SHIFT keys,
page 7 in the manual. Although the automatic selection is a feature
that's standard in most rigs, Azden opted to stick with the "old" way.

BTW, has anyone ever done anything about the REALLY ANNOYING ptt
operation whenever the keypad is pressed, whether it was intentional or not?
I don't have a print for the microphone, but took a guess & snipped a
transistor on the circuit board. Now, not only does the radio remain in
rx when one of the buttons is pressed/bumped, but I've lost touch-tone
audio as well :(

I think they need to clean up the rigs a little. Last night they were splattering all the way down to 14.202. :)

The West Texas Jamming Society are a fun bunch aren't they?

Amen! I have two such radios, and the NiCad packs last a long time,
the radio does not get very warm, even at 5 watts. I suspect something is very
wrong with the PA or a partial short on the power side. I ragchew a lot with my
radio, on high power, and it just does not get very hot--

Bleah. OK. It's time for a NEW and improved "MOD" technique. Cutting wires is cute but these things have to have some kind of moderately serious processor in them. The fact sheets boast about eeproms for saving programmed features so whats the chance we can hack a new prom to change the way the thing works? Just maybe theres an 8-bit uP one of us has seen before and a DIP eprom that contains the code within the TH-79.

The older Icom battery packs do fit the HTX 202. I have been using the
Renewal batteries in my 202 for several months now with no problems.
Could there be something wrong with the rig?

Hi all, When I was installing the tone decoder unit I noticed 2 green wires just to the left of where the decoder unit goes. These two wires look like they are jumpers of some sort and I pretty sure they are for the Mars/Cap mods. But I'm not brave enough to find out for myself, so I thought I would see if anyone has clipped these wires yet, and what they do.
Thanks in advance for any help.

Now you're talking, Al! I built my SB-102 in 1971 and I still use it as
a backup rig. The analog freq readout is good to within a few hunderd
cycles -- more than enough accuracy.

And while we're at it, how about a basic 2-meter mobile rig for around
$200?

Bill, for $200 bucks BUY BUY, better yet give me the address
& I'll buy!! The FT470 is an excellant dual band HT. The
yaesu rig has auto off-set, sub-tones, scan, dual scan, cross-band
rpt, power save if you are just monitoring one freq per band, etc.
I have one. I am very pleased. If there is a bad point it is the
low power output being a HT, but that is the only drawback.

Also if you try it on packet, you can NOT use the power save
option. You miss tooo much of the packets.

: I think SB102 might be more expensive to make now than a computerized
: radio. Imagine using good-size coils with high Q, good switches,
: adjustments, good dial without backlash... For a switching power
: supply, I still remember one from Yaesu. It was filtered extensively
: yet the noise was excessive for in-house antennas.

Of course you would use modern circuit design techniques to lower cost.
(I should have said the *functional* equivalent of an SB-102.)

If you chose an IF frequency at an even MHz (say 9 MHz) then you could
use a simple frequency counter to replace the mechanical dial. (Just
use the kHz digits, since you already know what the MHz are.)
A cheap "flubber" membrane keypad could be used to replace mechanical
switches. And so on, you get the idea.

Jeff,

I would not "sweat" the hot rig, but you would be wise to
only use high power when necessary to keep the problem in check.
My th78 gets pretty hot with extended xmit, but has not shown
any problems so far. I have put it up as a 5W digi and it
survived with no complaints.

Good luck with what appears to be a sweet rig

: 1. About $600
: 2. When the FCC approves it.
3. I think 449 pounds (UK), orders are being accepted. Visa(also known
as Barclaycard) and MasterCard(also known as Access) accepted. You
receive better exchange rate if you use a charge card.
4. As soon as Javiation UK starts receiving them. Delivery is via UPS
International (Red). No vat taxes, but there are import duties.
My experiences show this is typically two-three day delivery. If it is
shipped on a Friday, you may actually see it on a Monday!
5. Javiation offers the no quibble 1 year warranty and full INTERNATIONAL
version (nothing removed). EBB/EDCO can not beat that, maybe they should
open an office in a foreign port -- then they could offer the same.
6. FCC approval not required for units not purchased for resale purposes.

Icom America has come out with a new marine band radio which appears similar in size and shape to the IC-2GXAT unit. The interesting thing about this radio is that they claim it can be immersed in water at 1 meter for 30 minutes without damage. They're talking salt water, which will usually eat anything...

I'd like to see them make a Ham handheld in that casing, or a dual 2 meter/ marine radio. Either would be useful when out kayaking...

I would like to thank everyone who replied concerning my request
for information about the Kenwood TS-520S HF radio!!!

I was overwhelmed by the responses!!

I have thus acquired a TS-520S by trade of some quipment with a friend.
This is my first HF rig, so now I must get to studying so I can upgrade!

The overal responses were as follows:

The TS-520S is a Good all-around basic rig

It is very durable, reliable, and easy to repair.

The average price should be somwhere between $300 and $400
depending on what accessories come with it.

Now that I have one, I am looking for anyone who would sell, or knows where
I can get any of the following accessories:

The digital display module
The external VFO
CW Filter
FM board (if exists)
External X-verters

I would appreciate you input on finding these!

Thanks again for all the replies!!!!!!

Sorry to use bandwidth for this, but does someone know the master reset procedure for the Kenwood TH-79A? I accidentally programmed mine into something of a black hole, and would like to reset everything. Unfortunately, I am at work, and my manual is at home.

Thanks,
Jeff, KC1MK

Source record: 225139

Somebody said it would not transmit with renewals? Yes, sound odd. Check
the voltage coming out of the pack. Perhaps you got a dud, or put one in
backwards (I hate when that happens).

I alternately use I think Icom BP -3 on mine. / swap rs battery with IC2A.

I also charge the RS battery in icom drop in charger with piece of cardboard
on bottom to set charging micro switches.

In addition I also charge my RS HT from a cigarette lighter plug directly into
the battery pack. (Which they expressly say not to do in the manual.)
I bought the extended warranty, figured, why not - if they fry, they are free!
Been doing it since april. Batterys still work fine, same capacity, no loss
of power that I can tell. I mainly use it in my truck, anyway, why not keep
in charged. It has current limiting transistors inside the battery case,
I guess if you applied 120vac you would fry them though.

six meter rig? john KO4MY

3368. Yaesu FT-ONE Frequency Stability

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-03 21:04:09 UTC
From: dubner@spk.hp.com
Message-ID: <Ctz96y.GJ5@spk.hp.com>
Source record: 225147

My Yaesu FT-ONE is getting a little long in the tooth. It's unfortunate that the rig wasn't designed with a master 10 MHz oscillator like a piece of H-P test equipment or a more modern rig (I assume -- not having been inside a modern rig) but the FT-ONE has oscillators at 20.0, 24.5, 48.615, and 54.280 MHz as well as other frequencies.

Every crystal oscillator in the thing has drifted considerably, some past the limits of their adjustment trimmers. I can put it on frequency but it continues to drift with age so I decided to re-crystal the rig.

Yaesu charged me $4 for a replacement 20 MHz crystal. Only $4! For that price, I figure I must be getting a cheap digital clock crystal (just like the original) so I set it aside. I've ordered the best crystals I could get (within my budget) from a crystal company.

What have other FT-ONE owners done? Perhaps I should ask "are there any other FT-ONE owners on the net", as I haven't seen any mention of them in rec.radio.amateur.*

From: Yves@g4udt.demon.co.uk
Message-ID: <775953489snz@g4udt.demon.co.uk>
Source record: 225154

The price is very good for a dual-band HT. I doubt the real value of the 5 watt battery pack...the HT will draw a high current and the pack will not last long. Additionally, there are possible health concerns about running that power so close to one's face.

The FT-470 did not have a very good reputation and I know several people who owned them and did not keep when for long as they were unhappy with the HT. I cannot recall the exact reason for the dis-satisfaction.

If your budget can stretch to the FT-530, I would recommend it. I use an IC-W2E which is also good and should be cheap on the second-hand market as it has not been made since late last year. I also have an IC-32E which is also very good (production must have stopped about 5 years ago).

3371. My el-cheapo VHF swr meter

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-04 00:38:14 UTC
From: sbertsch@magnus.acs.ohio-state.edu
Message-ID: <31pd9m$af6@charm.magnus.acs.ohio-state.edu>
Source record: 225138
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

In the recent past I posted a question - how do I make a cheap VHF swr meter? Well, I got lots of helpful replies (thanks to all!); most of these involved either 1) a PCB microstripline, or 2) the pickup loop under the coax trick. I started building no.2, but then...

Last weekend I was at the local ham radio emporium, when I espied a used RS swr meter, the real cheap one they sell for CB's. For $9, I figured, it's at least good to strip the meter out of. So I take the thing home, and hook it up to my 2 meter HT and a precision 50 ohm coaxial termination. The thing says 1.1:1. Then I try a 100 ohm load - damn close to 2:1. It must be working! Next, I reverse the connections; not so good, around 1.7:1 with 50 ohms. Sensitivity: with my HT @ 146MHz and 1W output, I could peg the meter with the wiper on the CAL pot about 40% from the ground end. Not bad.

Taking the thing apart, I discover a PCB stripline with 2 pickup loops, and a pair of detector circuits. The reverse loop is terminated with a trimpot, but the forward loop ends in a fixed 100 ohm resistor. Time to re-engineer the thing. Here's how...

1) Add a 1K trimpot across the 100 ohm loop termination. 49 cents at RS. Just stick it on the foil side of the board. The actual loop impedence measures 86 ohms at null.
2) The forward detector circuit has a 270 ohm resistor between the diode and the FOR/REF switch, the reverse circuit does not. This is isolation for the "field strength meter" circuit. Add another resistor to make both sides the same - there are already pads on the board for this.
3) Cut out the two diodes for the "field strength meter" circuit. It doesn't work anyway, unless you clip-lead the thing to your antenna.
4) Check the forward drop of the two detector diodes - if they're too far apart, replace them with a matched pair of 1N34A's.
5) Null the loops with a *good* quality 50 ohm termination.

That's it. For less than 10 bucks I've got a pretty good 2 meter swr meter. Even if you buy one new for $19.95, it's probably cheaper than anything else you'll find. Make sure you get the cheapo model, with the worthless field strength meter circuit; I have no idea what's inside the higher priced one. Mine is model 21-525B; except for cosmetic changes, I suspect the newer ones are the same.

It would be interesting to see if this thing works up at 440MHz, but I don't have any 70cm gear now. Any takers?

Now I can get on with building antennas, which is what I wanted to do in the first place. I'll let you know how the vertically polarized loop yagi turns out...

From: polland@Xenon.Stanford.EDU
Message-ID: <31pkaj$12e@Times.Stanford.EDU>
Source record: 225151

I posted this a couple of days ago and had many, many inquiries but no offers. I would like to sell the Kenwood TS-440S w/ AT either separately or will sell everything as a package deal.

1.) Kenwood TS-440S w/AT. Purchased two years ago for about $1,300. NEVER used. Has been sitting here for the past two years. I am not really interested in HF. Would like to get $1100 or best offer for the transceiver. Unit is in like-new condition. Will ship in the original box. (With manual and documentation)

2.) Trio CW Filter YK-88C Crystal Filter 8830.7 kHz (L71-0211-05).

3.) Service Manual for TS-440S with antenna tuner

4.) NPC Regulated Power Supply (25 amps). Meters for both Voltage and Current.

5.) Cushcraft 5-band HF Antenna (ATV-5). I mounted this on the roof for about 6 months until the neighbors started complaining. It does have some normal corrosion. It breaks down into 4 or 5 ft lengths.

6.) Kenwood MC-85 Microphone Control Station. This is Kenwood's Deluxe desk-top Microphone with built-in audio-level compensation (700 ohms) and undirectional electret condenser microphone.

I would like to sell everything as a package deal. I actually paid about $1750 for all of the equipment. Make an offer.

3373. Anyone have a Tropez 900DL cordless phone ?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-04 04:01:13 UTC
From: chrise@comtrol.com
Message-ID: <CtzsI2.GL8@comtrol.com>
Source record: 225146

Was hunting birdies this evening... and a most frusterating one was
on 435.200. After unplugging just about everything in the house,
I finally tracked it down to the Tropez handset. The thing was
"on-hook" while sitting on the coffee table, but was emitting
a fairly hot signal on 435.200 once every 1.5 sec approx. This
appears to be an artifact of its "homing signal"... which it
does periodically to check link integrity with the base unit.

What's wrong with this picture is that the phone is supposed
to be on 900 MHz and use a digitally scrambled modulation (not
spread-spectrum but something akin to G3RUH type modulation).

With my R7000 in FMn mode, I can plainly hear DTMF tones and voice
coming off this handset. Some much for the scrambling! And
what is it doing on 435.200 ? Maybe it needs to be launched
into orbit so it fully qualifies as an OSCAR... :-)

I'm looking for comments from others that have this phone and
equipment on 435 that could look for similar noises. Perhaps
mine is somehow defective...

I'll be getting in contact with Tropez to discuss this with
them.

Chris

3374. RX Antenna Tuner Mod TS-690??

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-04 05:29:01 UTC
From: carreiro@netcom.com
Message-ID: <carreiroCtzwKD.MHy@netcom.com>
Source record: 225143

In the July issue of QST, Hints and Kinks section on page 80, KE2SL writes an article outlining how to modify the Kenwood TS450S/AT to activate the internal antenna tuner during receive mode. This modification improves receiver sensitivity and selectivity on the TS450S/AT.

The article states in the 9th paragraph to locate jumpter W6 where relay K17 would normally be installed. The TS450S/AT does not have the K17 relay installed.

The Kenwood TS690S/AT is identical to the TS450S/AT except it has 6 meters added. There are two RF SO-239 connectors on the rear of the TS690S/AT, one for HF/6 Meters, the other for 6 Meters exclusively.

I would like to make the modification to connect the receiver through the internal antenna tuner on my TS690S/AT. The problem I have is that K17 IS installed on the TS690S/AT. I can only assume that this relay has something to do with the two RF connectors on the rear of the rig.

Is there anyone out there who as successfully modified their TS690S/AT to route the receiver path through the internal antenna tuner???
Any modification would have to route only the HF/6Meter antenna connection through the antenna tuner, as the internal tuner does not cover 6 meters.

Any help would be appreciated.

>73,
>Jeff, KC1MK

I've heard that some people put heat sinks on their HT's.
They do this by unscrewing the belt clip and screwing on a heat sink
in it's place. Apparently this keeps the radio MUCH cooler.

3379. Here is two RZ-1 mods

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-04 15:42:00 UTC
From: Tom WB7ASR <tom_boza@ccm.hf.intel.com>
Message-ID: <31r2am$el4@chnews.intel.com>
Source record: 225164
Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment,rec.ham-radio.misc,alt.radio.scanner

I forwarding the following eMAIL from NU8D

Tom, WB7ASR...

==========

I have one "mod" that one of my co-workers here at Xetron came up with. Put a (very small) 221k resistor (value not super critical) across capacitor C63 (which is a .47uf couping cap). You can put the resistor on the bottom of the lower pc board right across the capacitor pins that go through the board (the cap is a normal tubular radial lead electrolytic). This resistor will supply some bias to the audio switching FET (Q8) and prevent it from being biased partially off by the audio waveform. If you look at a sine wave before and after the mod, you will see one half of the waveform distorted (before).

A little harder mod is to rewire the volume control by reversing the wiper and hot lead. Right now, the .47uf couping cap sees a varying impedance (down to 0 ohms) because it is feeding the wiper of the pot. This means that all the lows will be rolled off at low volumes, but will be normal at maximum volume. This is the reverse of what a loudness control does. Reversing the volume control leads will maintain low frequency response at any volume.

Some additional info: The schematic shows the CORRECT wiring of the volume control. For both of our RZ-1's, the wiper and hot lead were reversed, causing the low frequency loss at lower volumes. This may have been corrected some time during production. There is a small connector that you can move the pins on to correct the volume control miswiring. To get to it you must remove the front panel. This must be done very carefully since there are 3 springs behind the vfo, scan and msg buttons that may fall out and get lost. Once you get it apart, the pins can be carefully removed from the connector and re-inserted in the proper locations.

For Sale:

MFJ-1278 Multimode TNC (CW, FAX, RTTY, AMTOR, AX.25, KISS...)
Dual port, 300 baud HF, 1200 baud VHF equipped
Includes cables, optional MFJ software and documentation
~3 yrs old, works fine (needs ROM upgrade for mailbox, though)
$175 (was ~$289 new w/software)

Datong FL-3 Multimode Audio Filter (non-DSP)
Includes 1 auto, 1 manual notch/peak + variable upper & lower cutoff
CW/RTTY/SSB options, includes cables
~2 yrs old, works great
$200 (is ~289 new)

Datong VLF Converter
Converts VLF to HF for your GC Rx
~2 yrs old, works fine
$60 (is ~$83 new)

Prices not particularly negotiable. I pay shipping. Email reply.

>>Any opinions??

>Motorola's radio service software (RSS) is proprietary and probably can't be
>found for free anywhere (legit..). You also have to have a radio interface
>box (RIB) and the appropriate service cable for the particular radio you are
>working with. With Motorola, just about every model of radio has a unique
>cable and unique software.

>The above mentioned MX 3X0 series... Be careful not get one that requires
>channel elements if you want it to be programmable. The systhesized models
>have an "s" on the top control panel.

I read in a small Motorola ad in the back of Mobile Radio Technology
magaizine, that Motorola is seeking legal action against a Canadian
company (C+ software or something like that) for selling code
capable of programming the Motorola handhelds.

I have also seen ads (in the same magazine) that sell just the interface
hardware and (in the fine print) inform you that the SOFTWARE must
be purchased from Motorola.

Does the above preclude your writing your own software (provided you
somehow figured out or obtained the protocol) and programming
your Motorola HT? What if you program someone elses
Motorola HT, BUT DO NOT CHARGE THEM FOR IT? If you legally
purchase a software configurable device, do you not have the

right to do with it as you please? Note that I am not talking
about doing this for profit!

3386. ANY MODS FOR TM-733A YET?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-04 23:26:50 UTC
From: keith.knipschild@asb.com
Message-ID: <9408042326.A9262wk@asb.com>
Source record: 225161

I read the schematics and see references to different
destinations for the TM-733. I an guessing that by removing the various
resistors listed, I can make the modifications to give the radio the
expanded TX & RX. Have you received any information about the mods.
available. I did make the "GREEN WIRE" mod. by cutting both wires. It
made the following changes:

VHF: Original RX range: 118.000 - 173.995
New RX range: Same as original

Original TX range: 144.000 - 147.995
New TX range: 142.000 - 151.995

UHF: Original RX range: 410.000 - 469.995
New RX range: 300.000 - 469.995 >>>> when RXing in the
300 Mhz range your actually
Original TX range: 438.000 - 449.995 in the 400 Mhz.
New TX range: 420.000 - 449.995 ex.. 300 mhz = 417.050
322.95 = 440.000
352.95 = 470.000
461.95 = 470.000
THIS WAS CONFIRMED BY ME !!!! >>>>>>>>>>>>>>>>> 367.95 = 485.000

As anybody tried using the Ramsey FX-146 on 9600 baud packet? Did it work OK? Did you have any problems??

Thanks, Rick, KD6VEG

3388. Kenwood TM-733A surprise features and bugs [LONG].

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-05 03:50:51 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Aug4205051@susie.vigra.com>
Source record: 225181
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I just put power to my new Kenwood TM-733A, made the first pass through the manual and tinkered with the controls. I've found some pretty interesting features and bugs, and got a few questions. Please post any responses (especially answers) to r.r.a.equipment, or e-mail me and I'll summarize. Thanks!

Here goes!

#
The radio is fully *DTMF REMOTABLE*! This one really surprised me. I was considering the Alinco 600T just because of this feature, so it's nice to find that the 733A can do it too. I'm suprised they don't advertise it.

The manual says this:
"... the TH-7 Dual Bander can be used as the controller in place of a keypad-equipped microphone. The TH-7 is a compact, handy FM transceiver available in the General market only."

Well, I've never seen a TH-7, but my Yaesu FT-530 can control it just fine. The DTMF control keys are exactly as shown on page 81 of the manual. Note that the microphone is *active* all the time, so any ambient DTMF tones near your mic will also change rig settings. This includes tones coming in on the other band and out the speaker! The mic is sensitive; I would disconnect it if you intend to run remote-controlled for any length of time.

#
Cross-band repeat isn't documented. (Why do manufactures insist on hiding this one?) I've learned how to enable CBR, but only via the remote control/mic (sequence is "D,C"). Anyone know a front-panel key sequence? To get full-duplex cross-banding, enable the Automatic Band Change (A.B.C) first.

#
The DTMF Paging & DTMF Squelch protocol (AAA*BBB) is compatible with my Yaesu 530. This is good, especially for low-power extender applications. Is this a common standard?

#
The Automatic Simplex Checker (ASC) (p. 60) is a complete joke. I don't know who designed this one, but they must have had a clear view of their colon at the time. It breaks your reception every two seconds or so to check if the input channel is receivable. The break is *very* noticable, and often deletes whole words. I think it's

equivalent to using the Scan mode between the input and output repeater frequency. I can't believe they boast this as a feature in all their literature. Am I missing something?

#

There are some serious bugs in the "DTMF Monitor" feature (Page 63: [PTT] + [DWN] + Power On). This feature supposedly lets you hear the DTMF tones you are transmitting. The first problem is that it only gives you a short tone from the internal speaker. This is not true to the transmitted tone that lasts as long as you hold the key. The much bigger problem is that it *mangles* the start of the transmitted DTMF tone. I have no idea why, but most repeaters interpreted it as multiple tones. It sounds like the short monitor tone is being mixed in and transmitted. It's definately broken. Has anyone else heard this?

#

There are two undocumented icons on the display; one is the "heart" symbol. Anyone know what that's for? It could just be a spare. I noticed they used the odd "spade" symbol to indicate AM receive, so maybe these were last minute extras. Dunno..

The other symbol is the graphic "X" for the far right button under one of the F-shifted menus. It seems to do something, but I can't figure out what. Any ideas?

#

From looking at the schematic, it seems that the only programmable memory is physically located in the detachable front-panel. I think this means that if I use my front-panel on someone elses radio, I get all my memories and settings. Anyone try this?

#

I've heard that this radio can be fixed for extended receive, including the Forbidden Band. I can't find any 800 MHz mods on the regular ftp sites, probably because this radio is pretty new. Has anyone found one?

#

You can't have two useful keys on the handset at once. Namely, the "Open Squelch" feature and the "Direct Entry" feature. Both of these want to be on the PF key *only*. Is there any way to put either of these on the other programmable keys? I wouldn't mind giving up the Call key for Open Squelch, but there's no way I'm giving up Direct Entry.

#

The "musical" frequency readback (p. 77) is pretty useless (for me anyway). It plays the digits as musical tones, which you are supposed to recognize and associate with digits. Hmm.. I'd rather have morse code readout or just a simple tone count. This would be especially useful for remote control.

#
Exactly what is the difference between Noise and S-Meter squelch? As near as I can tell, one has a digital level indicator, and the other doesn't. Is there some environment where the difference shows?

#
The whole front-panel is connected to the rig by *four* wires (yep, including the volume/squelch pots.) According to the schematic, these are: power, ground, data in, and data out. I'm wondering how hard it would be to make a PC interface for this thing and replace the whole display and controls with a full-screen version. It wouldn't surprise me if many of the programming limits were also imposed by the front-panel, and not the unit.

Overall, I've very happy with this radio. The remote mount kit gives me some really nice installation options, and the quick-detach panel is super theft protection. it's loaded with bells and whistles, and seems to perform well so far. I'm anxious to hear how others like this radio.

Happy Hacking!

I have a pair of kantronics D4-10 high speed data radios for sale. They have the default crystals which I think are 430.55 for 19.2kbaud packet. I was intending to build a high speed link but don't think I will get around to it. Both new never powered up. I have most of the manuals and connectors (have them all somewhere) . Make offer.

Also have a gracilis packet twin for sale that I got to hook up to one of the above radios.

Finger aw0g+@andrew.cmu.edu and read plan file to see if they are still available.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

It's a shame to retire my Drake UV-3 to packet service, now that virtually every local repeater requires PL tones.

So I've been thinking about setting up an outboard sub-audible and DTMF encoder. Now the encoder and the DTMF pad are easy to obtain. However, most of the encoders seem to want a 5-bit encoding of values from 0-31 to select the sub-audible tones.

The control circuits seem like a significant challenge. Does anyone know of a construction article or a kit for a sub-audible encoder with a human interface which is better than a row of dip switches?

Greg

There is no need to divert to motgage payment or to wait for RS. Just
buy a used rig. Do you buy a Ferrari after right after you obtain the
driver's licence when a 10-year-old Citation would give
enough excitement?

Used rigs with tube finals have extra benefit of being able to match
to higher SWR antennas without the antenna tuner. Such rigs can be
had for $200-400.

Communication Specialists has an encoder that can be programmed with
a 31-position switch. You could also use a pair of hexadecimal thumbwheel
switches with a little translation table, or an EPROM with a switch that
contains just the PL frequencies you need. How much room do you have
for the controls? Is there enough room for hex switches, a rotary switch,
or whatever?

Because many hams out there misuse it and 90+% are busting the
rules when using cross-band repeat. It is plain illegal
in some countries. If you are going to use it, please be
careful to choose your frequencies carefully.

3403. Yaesu ext mike/PTT circuit

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-05 17:39:22 UTC
From: e-reuter@uiuc.edu
Message-ID: <e-reuter-0508941239200001@skywalker.ccsm.uiuc.edu>
Source record: 225172

Would someone who has built (or bought and took apart) an external microphone with external push-to-talk for a Yaesu radio please send me the circuit diagram they used?

I am trying to build an external microphone with external push-to-talk switch (PTT) for my Yaesu FT-530 radio. Problem is, I am not sure of the best circuit to use. My Yaesu manual describes the mic jack as being 3 conductor, with the tip for the mic connection and the ring having DC voltage to bias the mic. No mention of the middle conductor.

I measured the ring connection of the radio jack and it was 5V below the tip connection, and appeared to have an impedance of 5Kohm between the ring and the tip. I suppose I could just wire the microphone directly to these two connections with the PTT switch in series (the mic I am using has an impedance of 1Kohm). But I examined one external mic with PTT at radio shack which claimed to work with Yaesu and it had a 470pF capacitor and 2.2Kohm resistor in parallel with the mic. The radio shack model used 2 of the 3 connections on the jack.

Any suggestions?

Ken, I think Steve's point is that most manufacturers *tout* xband and *then* don't document. That's silly. In the case of the 733, Kenwood prominently advertises xband repeat capability. If they're going to advertise it, they really should document it. Ideally with instructions on what to do *and* what not to do. And Steve's right. There's not a peep to found anywhere in the (fairly thick... pun intended :-) manual.

I'd admit to being one of the 90% who'd probably do it wrong. Not intentionally, but out of ignorance (and yes, I've got a copy of the rules). I really don't think hiding advertised features in the radio is the right way to address this problem.

OK -- you have a valid point. Manufacturers shouldn't really be advertising
x-band repeat. Many radios are incapable of doing it legally and
those that make the radio shouldn't be advertising a "feature" which
results in illegal operation. Unfortunately, how to do it right
is somewhat specific to the location of operation, and we all know that
a few generalized instructions is worse than none at all (sort of
knowing just enough to be dangerous). My FT-530 manual just says
to "choose your frequency pair carefully." Great. What does that
mean? I agree -- they should stop advertising x-band repeat
causes more problems than it solves.

Hi Greg.

It would be a very simple matter to program a ROM to output the correct 5
bit code when addressed by a pair of thumbwheel switches. You would simply
dial up a number between 1 and 31 inclusive and the ROM would convert that
number to the correct 5 bit code.

There are lots of ways to generate 5 bits of data. It depends on what degree of flexibility you need.

You could use a pair of hex or octal switches. Hex switches are available from most surplus dealers and octal switches turn up once in a while.

If you expect to need 12 or fewer tones, use a diode matrix and a rotary switch to get the codes you need. To do this, put a pull-up resistor on all five inputs. Ground the wiper of the rotary switch. For a given position of the switch, decide which bits you will need as zeros. Connect diodes from those bits to that position, so that the diodes pull those bits to 0.7V. Label the rotary switch with the resulting PL frequencies and you're all set.

You could combine the DIP switch and rotary switch approaches for up to 11 diode-programmed tones and one DIP-switch-programmed tone.

Finally, if you can get access to an EPROM or PLD burner, you can burn a chip to do whatever kind of encoding you want.

3414. Kenwood TM-733A CTCSS (PL) tone too strong! Fix?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-06 04:32:47 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Aug5213247@susie.vigra.com>
Source record: 225048

The transmitted PL tones on my Kenwood TM-733A are much to strong. I get a signficant hum and buzz from most receivers, and my audio reports usually mention it.

I called Kenwood, and they are aware of this problem. It seems they set the PL tone amplitude too high, and they think they may have a fix. Unfortunately, there is no trim-pot to adjust this, and the fix requires sending the radio in for service. The tech mentioned that he thought it was a resistor swap, but couldn't rember more.

I tried to call the Kenwood BBS to check for a service bulletin, but it seems to be down (no answer). Has anyone seen a bulletin for this PL problem? Last time I got through, there were no bulletins at all for the 733.

If it's just changing a resistor (even SM), then I think I can manage it myself and avoid a repair trip.

Anyone else run into this problem?

My experience and the experience I have heard on the net has been exactly opposite. The FT-470 has an *excellent* reputation. Primary complaints have been regarding receiving interference when in high RF areas. But the same complaint is valid for most if not all available dual band HT's.

Yaesu service has received generally good reviews on the net. Maybe not as good as Icom's but pretty reasonable.

I'm not entirely disinterested as I have owned one for three years or so. I don't have any complaints. In fact, as a result of owning this HT, I strongly prefer Yaesu for VHF.

Ne> Steve Haehnichen Vigra, Inc. San Diego, CA

I read Steve's posting shortly after pulling a new 733A out of the box, and tested the CTCSS. I don't have a service monitor, so I can only report what I'm hearing from a speaker, compared to the CTCSS sent by a couple other radios.

The 733A CTCSS isn't a lot louder than the other radios, but it is distorted -- to distorted to be considered acceptable.

In addition, the radio is not very good on intermod. Right now its sitting on top of an Icom 2410. I live in a fairly high intermod area, with several commercial towers within a mile. The 2410 hears a bit of intermod on a few VHF channels -- its rarely a problem. The 733 is hearing intermod on many more channels, both VHF and UHF, some of it very strong, and definitly a problem.

Too bad -- the 733's got some nice bells and whistles. But its not performing where it counts.

This one's going back. BTW, it is serial # 51101980.

From: btenison@butterworth.eng.auburn.edu
Message-ID: <Cu5Cz8.D3M@mail.auburn.edu>
Source record: 225046

Hello all! We are interested in the digital voice recorder specs for the RC-96 repeater controller. Basically, we want to try and design one from scratch using a readily available digital voice recording chip (a la radio shack). We need to know some specifics about the controller, and how it communicates with the DVR. The manual describes a serial stream of data that is sent (extended user function mode) that consists of 24 bits of information followed by a data stream which is (as best we can tell from the manual) specific to the DVR. Other than that any information would be greatly appreciated!

Thanks,
Bruce

My FT-470 suffered from poor isolation of LO/1st IF circuits from the outside world. When I was living in VK7 there was, within line of site, a commercial base station transmitter, and our local VHF VK7RHT repeater. When both of these stations fired up, I heard a cross-modulated signal - no matter what frequency I was tuned to in the VHF band. Further investigation revealed that the difference between the two frequencies was ... yes, you guessed it: the first IF!

Apart from that, a nice little rig, and less power hungry (IMHO) under normal ops than the IC-32A.

I have the following Amateur Radio Equipment for Sale. Would like to sell as a package deal. My investment to date is about $1700. Here is your chance to buy one of the best transceivers made for a deep discount.

****

1.) Kenwood TS-440S w/ Automatic Antenna Tuner. Purchased two years ago for about $1,300. NEVER used. Has been sitting here for the past two years. I am not really interested in HF. Would like to get $1100 or best offer for the transceiver. Unit is in like-new condition. Will ship in the original box. (With manual)

2.) Trio CW Filter YK-88C Crystal Filter 8830.7 kHz (L71-0211-05).

3.) Service Manual for TS-440S with antenna tuner

4.) NPC Regulated Power Supply (25 amps). Meters for both Voltage and Current.

5.) Cushcraft 5-band HF Antenna (ATV-5).

6.) Kenwood MC-85 Microphone Control Station. This is Kenwood's Deluxe desk-top Microphone with built-in audio-level compensation (700 ohms) and undirectional electret condenser microphone.

> 73, ka1njl

Recently I purchased an IC-820H and have been reasonably happy with it.
Afterwards, a friend forwarded an article by G3RUH reviewing the 820. Had I
seen that document before buying the radio I might have had other thoughts,
but the original motivation for choosing the Icom remains - an RF system
of modern design and manufacturing methods. I HATE WIRES inside my radios.
Needless to say the 820 still has wires inside, but nothing like my Yaesu
FT-290R (the original, pre-Mark II).

For all of Icom's hype about the radio being perfect for satellite use, the
gist of G3RUH's review is the radio is clumbsy for satellite use. Also
G3RUH says (out of the box, unmodified IC-820H):
Over the last six years I've tested innumerable radios for 9600 bps
operation. The Icom IC-820H now shares top place with Kantronics' D4-10.

(The latter is however 2-channel, crystal controlled and UHF only).

I would have mailed the article to you if you had included an email address.
Meanwhile I'll ftp it to ftp.ucsd:/hamradio/packet/tcpip/incoming/ and call
it ic820h-by-g3ruh.txt. Its about 20k.

I have the following Amateur Radio Equipment for Sale. My total investment in this HF System is about $1700. Please make a reasonable offer.

1.) Kenwood TS-440S w/Automatic Antenna Tuner Purchased two years ago for about $1,350. NEVER used. Has been sitting here for the past two years. I am not really interested in HF. Would like to get $1100 or best offer for the transceiver. Unit is in like-new condition. Will ship in the original box. (With manual)

2.) Trio CW Filter YK-88C Crystal Filter 8830.7 kHz (L71-0211-05).

3.) Kenwood Service Manual for TS-440S w/AT

4.) NPC Regulated Power Supply (25 amps). Meters for both Voltage and Current.

5.) Cushcraft 5-band HF Antenna (ATV-5).

6.) Kenwood MC-85 Microphone Control Station. This is Kenwood's Deluxe desk-top Microphone with built-in audio-level compensation (700 ohms) and undirectional electret condenser microphone.

& for powering the rig _and_ charging the battery from the car. Please send
& like/dislike comments about the FT-470 to jwh7k@virginia.edu or post to this

Overall: a great radio. I think Yaesu makes the easiest to use VHF/UHF
radios. They also make the only UHF radios that cover 430-450 MHz.
Go for it.

Nit piks: When both bands are on and the PL decode is ont it has some problems,
if I am listening to VHF with a PL decode on for VHF and UHF turned on
as the secondary (listen only) channel then the sound on the VHF
channel will have short momentary dropouts every few seconds. I won't
miss any words, but it is annoying.

The separate unit needed to power from an external power source is a pain.
It doesn't filter noise very well, and it reduces the power output if you
are running off the batteries.

It has intermod problems, especially with both bands turned on, but
name a dual bander than doesn't?

& Would someone who has built (or bought and took apart) an external
& microphone with external push-to-talk for a Yaesu radio please send me the
& circuit diagram they used?

& I am trying to build an external microphone with external push-to-talk
& switch (PTT) for my Yaesu FT-530 radio. Problem is, I am not sure of the
& best circuit to use. My Yaesu manual describes the mic jack as being 3
& conductor, with the tip for the mic connection and the ring having DC
& voltage to bias the mic. No mention of the middle conductor.

I have a 470, not a 530. I only use two wires. The tip has a few volts
to bias a condesor mic. Put 2 Kohm in parallel with the mic, and the
PTT goes in series. The 2 Kohms is what causes the radio to switch to
transmit mode. No caps necessary.

>to "choose your frequency pair carefully." Great. What does that
>mean? I agree -- they should stop advertising x-band repeat
>causes more problems than it solves.

A quick comment (with grins):

Based on your statement above, radio manufacturerd wouldn't be able to advertise any radios, because all transmitters have the potential of being used illegally.

Now the reply:

Actually, if you want to use the cross-band features of your radio; first, you must operate in the repeater portion of the bands as that is what you are running, a repeater. Secondly, to keep things legal, if the radio doesn't have the facility to automatically identify itself, you must identify for it (and don't forget to do the ID through both directions of the link since there are two xmit freqs being used). Thirdly, if your radio is capable of being controlled via the remote, only do the controlling from a 220 freq or higher (since the FCC doesn't allow repeater control below 220).

Gee, Jerry, you can pick up an old HF rig for between $100 and $200 without hardly trying, in used but quite servicable condition. That's for 5 bands, 200 watts, CW and SSB. HW8s and such go for a bit less. Then again, quite a few Elmer types will happily pull an old rig out of the back of the closet and let you play with it for a few weeks.

If your mortgage payments are that low, I'd like to trade.

Message-ID: <325ei7$mqf@jac.zko.dec.com>
Source record: 225068

I have been out of HF operation for about 12 years when I had a Heath HW 101. Well I am about to buy my own house where I can put up a real antenna and I would like to get back into it. But as I said I am buying a house so I do not have a lot of free cash. I have been to a couple of flea markets and I see that I can get a Kenwood TS520 or Yeseu 101ZD for the $300-400 price range. My question are, and I hope this does not start a religious argument, are these good buys, are these 2 equivelant, and can I get something much better for a little more money?

Any help before I go off and do something rash would be appreciated.

Thanks
Howard

Source record: 225069

For late model Ford Explorers, Aerostars & pickups.
Some products have a long 'ground' lead from the fuel pump (in fuel tank) to left front fender well area.
This makes great antenna to radiate rf noise from the fuel pump.
Bonding this lead to frame as close as possible to fuel tank will aleviate most of the noise problem. A rf choke from Ford or Radio Shack may still be necessary for some instalations.

Those vehicles that have the factory "TOW' package will have common ground in the harness for the trailer hookup which may be utilized for this purpose.

This the official Ford fix from 'Ford Light Truck Engineers' at FCSD Hotline in Dearborn.

Feedback concerning this field fix can be directed to:
Mark McIntyre A.S.E.T.
1-800-762-1103

I will also hand carry E-mail to Mark if necessary.

Personally I'm only involved as a Ford owner and Amateur radio operator.

3443. Kenwood TM-733A PL problem - the real story

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-08 15:04:55 UTC
From: depolo@eniac.seas.upenn.edu
Message-ID: <325hin$c5i@netnews.upenn.edu>
Source record: 225070

There has been discussion here and on local repeaters about the Kenwood TM-733A's PL being "too loud". After looking into it, and talking to Kenwood, here's the whole story.

Many 733's out there generate an audible hum when the PL encoder is turned on. Kenwood and its dealers are telling people who complain of this malady that it is because the "PL is up too high". However, this isn't really the case. The truth is that there is a noticeable hum *not on the PL frequency* that is induced when the PL encoder is turned on. The real PL is there, and on the unit I tested, was in the ballpark as far as deviation goes, however, there was the additional tone/hum being generated at the same time, which made an accurate deviation reading difficult.

So, in a nutshell, there is a defect. Turning down the PL deviation may help lower the amplitude of the hum, but it is also going to lower the real PL tone as well. The nominal value for PL deviation is 750 Hz, with 500 Hz and 1000 Hz being the limits. Most amateur rigs that I've tested tend to be below the nominal 750 Hz value to begin with. Turning down the PL even more to reduce the hum problem is going to keep 733 users out of most PL'ed repeaters, so don't let a local service shop turn down the PL deviation. Send bad 733's back to Kenwood directly so that they can fix the defect.

Users may note that the problem seems to appear on some repeaters, and not on others. This can be due to several reasons. First, the hum itself is down near the PL range. On the unit I looked at, while generating a PL of 131.8 Hz, the hum was up around 260 Hz. Most PL'ed repeaters filter out the PL that comes in the receiver via a high-pass filter with a cutoff around 300 Hz. So, on repeaters configured as this, the hum may not be noticeable to listeners. Other repeaters don't filter PL, either intentionally or unintentionally. On repeaters like this, how loud the hum sounds will depend on what the low-frequency response of the system is. Finally, on a small number of systems, a steep notch filter is used just on the PL frequency that needs to be filtered. So, the real PL tone is filtered out, but the hum is allowed to pass through and is apparent to listeners. This is how our system is configured, which made it obvious to me that Kenwood was blowing smoke about the "PL being up too loud" since 733 users all had hums on their audio, even though the system PL (131.8 Hz) was being filtered properly (about -50 dB).

It may be possible that Kenwood is telling their dealers of the "PL up too high" problem just to save face rather than admitting that they left a seemingly obvious problem slip through the cracks during product testing. When I asked them straight up what the story was, the person I talked

to admitted that there was a problem. However, when a friend called and
said that his radio had a hum, they gave him the "PL up too high" story.
And the dealer he bought the radio from told him that the PL was set loud
on purpose because most "commercial repeaters" require a louder PL.
What kind of load of BS is that? First of all, the 733 isn't type
accepted for commercial use. Second, there is no difference between
a "commercial repeater" and an "amateur repeater." For the most
part, amateur repeaters are Motorolas, GE's, Johnson's, etc. Go figure.

I don't have any answers, but I have noticed the strange beeping. It is
somewhat irritating and perplexing.

I suspect the squelch not functioning as effectively is due to AM detection
versus FM detection. I usually just bump my squelch setting up to 3 or 4
when monitoring the aircraft band.

The wide decimal point indicates that you are doing a A3E
demodulation instead of F3E. Have no idea what the
beeping is.

Can someone do me a favor and look at the schematics?
Did Kenwood do the same idiotic thing as Yaesu did with
the FT-11/41R and use the CPU to generate the PL(TM for Mr.
Beckman) tones? My FT-41R generated a very poor quality
PL tone, because of this method of generation. Not only
was it poor in quality, it was off frequency. I finally
had to force Yaesu to install a tone board, which generates
the PL tone in addition to decoding. This fixed everything.
I'm just trying to figure out if this is what is the
latest trend....

3454. Linear Fades out.....

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-08 22:04:07 UTC
From: briane@goofy.iaccess.za
Message-ID: <8GgHk4XjZtoL061yn@goofy.iaccess.za>
Source record: 225083

Greetings to all,

I use a Tono 1300E linear amp for VHF operations. It has a fault that puzzles me, in that it fades out from the moment I press the PTT down to a very low level. This amp is rated at 110-130 watts, (10-15 input), but when triggered into a (good) dummy load, it only peaks at 70 watts (15watts in) and immediately begins dropping in output down to about 35 watts. I have ruled out power supply problems as I am running it off a battery bank of 100AH cells and thru the whole fade out, voltage only drops from 14.3 to 13.98 volts, still slightly above the 12.5 minimum specified by the manufacturer.

Incidentally, the final tranny is a Motorola MRF245. I would really like to get this linear firing at 130watts constantly, any suggestions?????

Please e-mail me, or post them up on this group.

TIA.

Cheerio,

I have a 470 and find it to be a great general purpose, dual bander. I had an IC-W2A that was stolen and replaced it with the 470. Intermod trouble was about the same for both radios. I have never heard any call a dual band hand held "bulletproof". Not a lot of bells and whistles. There could be better isolation between the two bands.

Howard...

The Kenwood TS-520 and the Yaesu FT-101ZD are both decent "hybrid" (solid state receiver, tube finals in the transmitter) rigs and worth the money, but they were both already out of production when you quit ham radio 12 years ago. They date from the 1970's. For another $100 or so, you can get a fully solid-state rig, the Kenwood 120 for example. You havn't lived until you have been able to QSY to your heart's content without returning ..retuning...the transmitter.

3461. Need some help with the design of an Operational Amplifier

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-09 05:16:57 UTC
From: christos@kuhub.cc.ukans.edu
Message-ID: <1994Aug9.001658.70244@kuhub.cc.ukans.edu>
Source record: 225089
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

hello there,

I have a question concerning design of a simple amplifier using
operational amplifiers. I am simply designing a noninverting amplifier with a
gain of 2, that is R1=R2 (Closed Loop Gain=(1+R2/R1)). No matter what I apply
to the input of the amp the output always saturates to -11 Volts. Even if no
input is applied the output still gives a -11V.
The voltages that I am applying to the Vcc+ and Vcc- of the op amp are +12V and
-12V respectively. I am using the LM 741 opamp for this application.

Does anybody in this group happen to know what the problem might be?

I would appreciate any relevant response.

Please e-mail.

Thanks in advance

Chris

Source record: 224997

Hello,

This is my first post to this group, and hope this message fits the charter
of the group.

My brother was given an old handheld by a friend, and was wondering what is the use of it, since it doesn't cover the amateur frecuencies.

It is an old looking Ten Tec, model TT-990, with a rubber duck antenna, and a
box or compartment of rechargable cells under it, that can be removed. The body of the hanheld is metalic, with a brownish color.
The frecuencies showed in the cristal screen are about 128.000 Mhz, and up
to about 134.000 Mhz. Seems to be AM
We have not heard anyone transmitting in these frequencies yet.

Do you know what is the use intended for this rig, and how much would be its value? Who can be interested in it?

Muchos thanks in advance!

Ricardo Rodriguez M.

Does anyone know a source of the power plug for an ICOM W21AT other that ICOM. The local dealer wants $14.95 for the OPC-288/L power plug which is really only a pig tail with a special connector.

The connector looks like a 3.5 mm power plug but the positive part is male instead of female.

Any ideas?

I've recently picked up a couple of clean 7625 Kenwoods. They are a synthesized, no bells/whistles radio, with one memory. These radios have a 24 or 25 pin connector on the back that allows remote programming of the synthesizer using bcd. Does anyone know of a reasonably simple circuit that would allow simple remote control access via this connector? I do have the service bulletins, and can figure out a way to diode matrix this, but wonder if there is an eaiser way. I also wonder if there was ever a commercial interface built for it.

Any words of wisdom from the remote base crowd in CA would be appreciated (as well as others, too).

> voltage and amperage cause a problem?

The voltage might, but it shouldn't really be a problem. Check the 202's
specs for maximum voltage -- it's probably 14V or more.

The current rating of a power supply is a maximum. Anything less is
generally OK, though some switching supplies specify a minimum load
current as well as a maximum. How do you find out whether your HTX-202
will overload the supply? Easy -- check the specs again. This stuff
is always in the manual somewhere, usually near the beginning or the
end.

For reference, my Heath HW24HT dual-band handheld is rated to operate
on anything from 5.5 to 16V and draws up to 1.3A, depending on the
output power and the band. Your power supply would work with it; in
fact, it can supply enough current for two radios like my Heath.

Oh, one more caveat: Be careful if it is a switching power supply.
Some switching supplies have large ripples at a couple of kilohertz
on their outputs. The result can be a whine in a radio's output. The
only way to see if a particular switching supply works well with a
particular radio is to try it out and request some signal reports.
Linear power supplies don't have this problem.

Ne> Does anyone know a source of the power plug for an ICOM W21AT other
Ne> that ICOM. The local dealer wants $14.95 for the OPC-288/L power plug
Ne> which is really only a pig tail with a special connector.

Ne> The connector looks like a 3.5 mm power plug but the positive part is
Ne> male instead of female.

Ne> Any ideas?

I've been looking a long time, and never found one. This topic comes
up on various echoes from time to time, and no one has produces a source.

I put an in-line connector in all my 12-volt radio cords so cords and
power supplies are easily swappable. That makes a couple expensive
ICOM cords do the work of many.

Yeah, I don't know why I didn't check the specs for the max voltage,
which is 13.8V, must have had a brain seizure or something.

Anyway, thanks for the info about current drain, I wasn't quite sure how
that worked. I guess since the specs don't say anything about a max
current, 3A shouldn't hurt anything.

That's a place called Merrymac or something like that. It's in Katy, TX (a western suburb of Houston). They are on Genie, and you can order direct from them on there, or check directory assistance for their store phone number in Katy. Thier prices are always cheaper than normal Radio Shacks.

I have a Kenwood TR-7950 (granted, not a HT...) that has the original lithium
back-up battery. I've had this radio for about 10 years now. I would think
that lithium batteries are made in a few standard sizes.

: Now that HT's have been around for many years, is there any accepted
: wisdom on how long the lithium backup batteries, on average, will last
: in normal service?

Steve: It depends on the HT. I have a couple ICOMs that only use
the backup lithium when there is no battery pack and use the pack
to pwr memory even when the HT is switched OFF! I expect shelf life
(10 yrs or more.) Most HT's don't do that and use the lithium
battery when the HT is off. I'm guessing here but 2 to 7 yrs with
abt 5 yrs as typical.
Obsolete? Yeah, I think those ICOMs use obsolete lithium batteries.
I expect I'll just look for something the same size with similar
solder tabs if I ever have to replace them.

I have a TS790 and it has performed well. I cannot compare it to the other
rigs. The TS790 is a complex surface mount machine. It does not lend itself
to do-it-yourself fixes. I have had some problem with varing power output
under various conditions. Other than that it works good. I use mine on
satelite (when I can get on) Let me know if you have specific questions.

Bruce & Greg-

Communications Specialists also has a model that includes the switch, as well as a case. It is the TE-64, which generates 32 CTCSS sub-audible tones, 19 burst tones, 8 touchtones and 5 test frequencies. It uses a 32 position switch, with a two-position switch that selects either the CTCSS tones or the others.

It costs more than twice what the DIP-switch model costs. Are you sure you wouldn't prefer one of the tiny units that fit inside the radio's case? The SS-32SMP is jumper-programmed, and quite small compared to the TE-64.

Lithium batteries used for memory backup in most handhelds and Ham gear are the coin cell type. These are usually 20 to 24 mm in diameter and 2.0 to 3.2 mm thick. These have a large surface area "crimp" type seal that will allow the the slow release of electrolite and gasses.

Shelf life of "coin" cells at room temp is usually about 7-10 years to 80% of rated capacity. With low microamp draw, I would expect from 5-7 years of life before replacement is necessary. Constant elevated temperatures (above 35 C) will cut life in about half. Temperature cycling (lots of hot to cold temp transitions) will also impact the seal and decrease battery life.

What I suggest is to check the cell voltage and replace any "coin" cell type batteries that have a voltage at 2.9V or below. I make it a practice to replace things like these on a maintenance basis instead of waiting for them to fail.

Luckily, most coin cell manufacturers have standardized on cell sizes. The big difference seems to be the PC pin configurations (or footprints). Sometimes I have had to "make" em fit, but have always been able to secure them in place. Sometimes you can replace a CR2325 cell with a CR2032 because the pin spacing and footprint are the same, and actually, the CR2032 has more capacity than the typical CR2325.

Hello. HELP!

I have bought a Motorola Hand-Held for conversion to 70cms ham band.
It is a MX-360 10 synth rig,

some one did ansewr a previous request for help but |I have lost the message,
all I know that is they worked for Motorola in the United States.

I have been infromed that It will need new chips inside, and special programming. plus the equipment to do this... I have Tried Motorola UK with no luck, I have also tried a friend who works on Motorola rdaios and he has had no luck either...

I would like to get it to work on 70 cms as I have very little money (dont we all) If any one has ANY info about these radios it would be VERY much appriciated.

I have aslo been told that the Storno 4000 series UHF H/held may be better for me as these have conversion details avilable..

If any one has got one of these for sale (CHEAP) I may be interested

I dont know if this echo gos world wide, but if it does'nt would someone post it overseas if possible ......

Thanks VERY much

Regards,

I)ave Smith. G7PKS. (GB3SR repeater Group) (part of the S-14 mob)

3501. More on Kenwood TM-733A PL problems.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-11 02:19:58 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Aug10191958@susie.vigra.com>
Source record: 225031

I just received my Kenwood TM-733A/E Service Manual today, and immediately checked out the CTCSS (PL) section, since the tone on mine and many others is filthy with harmonics and artifacts.

I have some bad news. It seems that the tone is digitally synthesized and not subjected to much filtering. There are seven digital output lines from the CPU going into a ladder resistor network (DAC). The one (analog) output from the network gets directly coupled into the incoming microphone audio via a 470 Kohm resistor (R256) and .0082 capacitor (C285). There is one trimpot *after* they have been mixed.

Here's their description of the "Tone Output Circuit":
The signal is input to CP401 (ladder resistor) from P41 to P43, and P50 to P53 of the CPU, and converted from digital to analog to produce 38 signals of 67.0 to 250.3 HZ. Figure 10 shows the internal configuration of CP401.
[Figure 10 shows resistor network diagram]

It looks like we can't even turn down the PL deviation (which appears to be normal) without a part change. The one trimpot would knock the microphone level as well.

I'm curious to know what Kenwood's current service procedure is for the radios people are sending back for fixing. They rep I spoke to thought the PL was too strong and should be turned down by replacing a resistor (probably R256). Others here have commented that the PL strength is just fine, but the tone itself is not clean.

Kenwood's BBS has not been answering since Friday. Has anyone been able to check if there is a Service Bulletin addressing this?

For anyone else wanting the TM-733A/E service manual:

3502. Kenwood TM-733A: Undocumented "Assembly mode"

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-11 02:26:12 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Aug10192612@susie.vigra.com>
Source record: 225032

In the TM-733 Service Manual, it describes a test mode that I haven't seen mentioned anywhere else. So, here's the scoop:

Entering Assembly Mode: [CALL] + [MUTE] + [Power On]
All LCD segments should come on. (To exit, power off.)

Press the [VFO] key. *This must always be done first*
The serial port is checked and "F" with "80" on the display indicates test passed. "1" or "2" means failure.

Different keys now show different displays, with [LOW], [SHIFT], [TONE], and [REV] also adjusting the backlight intensity.

Set the dials to minimum, then press the [MR] key. Each of the dials shows the digitized level.

This looks useful for checking all the keys and dials when you suspect a bad connection.

Have fun!

3505. 800 MHz receive module in Kenwood TM-733A

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-11 04:09:38 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Aug10210938@susie.vigra.com>
Source record: 225033

Page 25 of the Kenwood TM-733A/E service manual has an interesting diagram labeled:

800 MHz Front-End: KCB28 (Tx-Rx Unit B/4 IC202) Except K, P Type.
(What is type K, or P?)

It's an internal schematic of IC202. The external connections are:
RF
E (10 of these, all grounded)
IF (MCF on schematic)
L0 (HET on schematic)
Vcc (80R on schematic)

From the 430 MHz module schematics, it looks like the RF line is connected to the antenna via three capacitors (in series) and two inductors (to ground). That small section is outlined with a dotted box and marked "*B", leading me to suspect it's not installed on all radios. Wouldn't be hard to add..

The MCF (IF) pin 7 is mixed into the UHF signal just before the BPF. Pin 13 (L0, HET) goes into some kind of rectifier module I don't understand. Pin 14, interestingly named Vcc and "80R" goes to Q203, a power switching transistor, which is controlled by IC206, a "Shift Register".

This Shift Register has outputs for:
14R (144 MHz?)
80R (800?)
43R (430?)
36R (360?, goes to IC203, "36RF", which seems to do 440 as well)
FAN (yep, Fan power transistor)
MID
NI (both go to Mid/Low switching)

Sooo.. I guess the questions that come to mind are:
1) Do US radios have this 800 MHz module installed?
2) How does one ask the microprocessor to enable that output of the shift register?

Happy Hacking!

I don't know about MARS, but Civil Air Patrol opperates on 148.15, with an offset of -4.25 for voice repeaters. They also have 149.925 for packet and one 10m freq I can't remember right now.

Here in Mo we have 149.895 for packet, and I believe from the last Wing
Conference that most other states do too.

Hi es tnx for reading this,
I have got an ft757gx of my own. That is an very useable small tx. But if my one is just powered on i have got a bit trouble. The trouble is discribed like a jump on working frequency by aboute 600 Hz. When the tx is running a while, that means it is warms up then the jump dos not occur anymore. I think the problem must be caused by the not proper working of the pll-loop. I think it should be possible to repair it by adjust the loop. but unfortunately I have got no manual. I there is someone who can help me out I would be pleased. Of course I will pay the cost for copying and so on. Thanks in advance es 73 de Wolfgang (DL7VWH)

10m? You sure? 11m might be more like it--just south of the CB bands (26.620 MHz)

As far as I remember, that band was eschewed as soon as folks could get on 2m.

They're also using 148.975 I think.

From: nf0r@slacc.com
Message-ID: <14273NOOLCXIGOMTXTK@slacc.com>
Source record: 224951

Hello! I'm still looking for an old Davco DR-30 receiver. Also the matching DR-30S power supply/speaker and a DT-20 SSB transmitter.

Prefer equipment in working condition but d.o.a. is probably okay too.

Davco quit making radios in the late sixties but there must be one or two out there somewhere.

Please let me know if your would like to sell yours or know of someone else who might be interested.

Many thanks de Dave, NF0R nf0r@slacc.com

Basically that was the gist of G3RUH's review of the IC-820H, a copy to be found at ftp.ucsd:/hamradio/packet/tcpip/incoming, that the human interface was lacking. The 820 does not have variable front-panel power output control, unless you consider Hi/Lo to be variable.

On the other hand the IC-820H has an accessory jack that, as I recall, includes PTT wired in parallel with the MIC PTT. This would be usefull for keying an ampifier. Same jack has the 0 to -4v ALC input to attenuate power output.

Last night I heard activity on 145.815 with my FM dual bander and quickly rigged my IC-820H to copy with my ASA dual-band vertical. All smiles. Everything was S0 and distorted by the mis-polarization of antennas, but now I need to hold G3RUH's document in one hand with my radio in front, and decide if I agree, or if Icom changed things for the better. Specifically, I had no trouble tuning either Main or Sub bands at 10 Hz resolution.

When I get proper antennas, I'll try to transmit.

: I suspect the damn things will last *just* long enough to be obsolete,
: discontinued, ie. buy a new radio.

My Standard C168A makes use of EEPROM technology. In fact the memory is on
a little plug in board (accessable when the battery is off the radio). You
can buy extra boards and swap them in and out as desired. This is handy if
you travel regularly. You can program up a board with all the repeaters at
at your destination. You have another board programmed with all the repeaters
at home. Instead of RAM that has to be battery backed up the EEPROM on this
little board essentially gets programmed every time you change/update what
you have stored in memory. It is there forever, even if you remove the board.

3514. Temperature Telemetry

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-11 17:23:31 UTC
From: oflber02@uctvax.uct.ac.za
Message-ID: <1994Aug11.192331.1@uctvax.uct.ac.za>
Source record: 225041

I am currently doing a thesis on a Perishable Goods Temperature Monitor.
The thesis calls for a temperature probe which is packed with the goods.
An interrogator then interrogates the probe and a reading is given.
The problem is that the probe is not allowed to have a power source at all.
The interrogator is hand-held and is powered by a battery. An option is
to have a rechargeable set up.
The probe must be as light as possible and as small as possible.
The system must be able to read temperatures between 233K and 313K
with an accuracy of 0.5K
I have thought about using a telemetry system or a transponder.
I have thought about using magnetic, acoustic, RF or microwave coupling
but I do not think I will be able to get enough power from a meter away
to power a IC like the LM35.
The interrogator must be able to receive the temperature from a meter away.
The only thing I have thought of that might work is an oscillating circuit.
The oscillation frequency changes with temperature.
A dip meter is then used as the interrogator.
The only problem is that the only thing I can think of that will vary with
temperature is a bimetallic strip.
The strip can then be used to change the capacitance of the oscillating
circuit.
However I need a circuit for a dip meter which can constantly scan the
frequency range and be able to differentiate the dips so that the required
accuracy is obtained.
Any help or ideas and suggestions are needed and very welcome.
Please send mail to
oflber02@Uctvax.uct.ac.za
Thanks in advance

Arrrrrrrrrrrrrrgggggggggggggghhhhhhhhh!!!!!

Looks like this is the new "cost reduced" == CHEEEEEAAAAPP
method of putting PL encode in the box. The Yaesu
FT-11/41R HTs do the same thing, and it has the same problem,
really crappy PL. Moreover it was off freqeuency.

The final solution was to put a tone decode board (another
way of extracting $$$ from us poor hams). The Yaesu
DEcode board also generates tones for use during ENcode,
and overrides the CPU generation. The tones now sound
great. Moreover, I got Yaesu to put the decode board in
under warranty for free.

My adivce. If the PL performance is so poor that it is preventing
use of repeaters (especially those with reed decoders), then
lean on Kenwood. If the installation of the optional decode
board also overrides the CPU generation of the PL tone,
then insist that they install it for free under warranty.
If we all make enough of a noise, the manufactuers will forget
about using this method. Maybe they will just put a tone
decode board into the unit from the beginning, like the FT-530.
The increase in cost is minimal to do it that way....

==Ken

p.s. Yes, Mr. Beckman, PL is a registered trademark of
Motorola for CTCSS. Happy now?

For crying out loud ....

Since I am Civil Air Patrol, I will tell you.

On VHF-FM: 148.15 and 148.125 are repeater outputs. 148.1375 is designated
the ground to ground TAC channel. 149.5375 is the Air to Ground TAC channel.
The repeater freqs are in the 143 range, but you really don't need them ...
CAP has enough trouble with our own members kerchunking machines, let along a
bunch of hams with it programmed in. 149.895 is the CAP packet freq with
149.925 being used only on stations within 50mi of the Canadian Border.

The 11m channels is 26.620 . CAP also has two more freq assignments in the
143 range for control link purposes.

There are a whole slew of HF freqs in CAP, 2 in the 2 mhz area, and most of
your region's primary freqs are in the 44xx, 45xx, and lower 46xx bands.
The national emergency channel is 4585 USB. Also check out 7635 and 14902
mhz usb. There are assignments in teh 11mhz and 20mhz band, but they are for
long haul CLOVER links.

Hope that can help you ...

From: steveflu@microsoft.com
Message-ID: <CuE81o.DzL@microsoft.com>
Source record: 224947

I'm trying to decide which mobile dualbander to buy. Two that
I'm considering are the ICOM IC-2700H and IC-2340H.

I'd like to hear people's comments - what you like, what you
don't like, usability, audio quality on xmt and recv,
intermod performance, etc.

In addition I have a few questions:

1) The ads say the 2340 has cross-band repeat. Does the 2700?

2) The 2700 does dual in-band receive. Does the 2340?

3) Do either of these have a data jack? Does it do 9600bps?

4) Are they remote-controllable using DTMF from an HT?

5) The ads for the 2340 mention a voice synthesizer. Is
that also available for the 2700?

6) I assume these do not have build-in antenna duplexers,
correct?

Post or feel free to email me directly at steveflu@microsoft.com.

Thanks
Steve (whose Tech+ callsign should arrive any day now)

3518. Yaesu dualband mobile info needed

I'm trying to decide which mobile dualbander to buy. Two that I'm considering are the Yaesu FT-5100 and FT-5200.

I'd like to hear people's comments - what you like, what you don't like, usability, audio quality on xmt and recv, intermod performance, bugs, etc.

Also, I have some questions:

1) I believe both of these have a data jack on the back - correct? Does it support 9600bps?

2) Can these be remotely controlled via DTMF? (Yes, I am aware of the legal issues involved.)

3) Are there any differences between these two other than the 5200 having dual in-band receive and 32 memories and the 5100 offering remote mounting and 94 memories? Do they take all of the same accessories?

Repond by posting or feel free to email me directly at steveflu@microsoft.com.

Thanks,
Steve (Tech+ callsign on the way!)

In <Cu6x4J.Iuz@srgenprp.sr.hp.com> frankb@moto.sr.hp.com (Frank Ball) writes:
>Nit piks: When both bands are on and the PL decode is ont it has some problems,
>if I am listening to VHF with a PL decode on for VHF and UHF turned on
>as the secondary (listen only) channel then the sound on the VHF
>channel will have short momentary dropouts every few seconds.

I've noticed that also. It's very annoying. I always end up turning off
the secondary band when listening.

Other minor nits:

CTCSS decode only works on the primary band, the secondary band has no
CTCSS decoder even if the channel is programmed for CTCSS decode.

Also, the "balance" control to vary the volume between UHF and VHF is
useless. If you turn it far enough to make the difference in volume
noticeable then one of them is too loud and the other too low to hear. I
eventually figured out it's best to leave it in the middle and never move
it.

But those are still minor complaints, I like the radio a lot.

From: notredame2@aol.com
Message-ID: <32emnj$5q0@search01.news.aol.com>
Source record: 225038

Well, I just started getting QST THIS month, so I can't really look back and find a review..here's the question. I have looked at getting a data controller for several months now, and am tied up between two. AEA makes a beautiful PK-900, but it just doesn't seem to do as many modes or have as many features as the MFJ 1278B. The 1278B is basically 200 dollars less. I figure there has to be a reason other than the LCD display on the PK-900 why it costs $200 more than the other. The MFJ seems like you're getting the most for your money. I have heard NOTHING whatsoever in reviews of both, so some help would be greatly appreciated. Thanks in advance! 73's...

3527. Quadra 610 DOS/Packet Gold <-> PK232 Help: It's not working.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-12 04:08:07 UTC
From: keating@nosc.mil
Message-ID: <1994Aug12.040807.17996@nosc.mil>
Source record: 224952
Cross-posted to:
rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,comp.periphs,comp.sys.mac.comm,comp.sys.mac.misc

Hi. We have a problem with a Mac serial port controlling a PK232MBX:
My father, WA7JHA, used PacketGold v8 with his AEA PD232MBX on an IBM
286AT clone for years.

Now he has upgraded to an Apple Macintosh Quadra 610 DOS machine which
has a 486 chip
on board with DOS 6.0 and it runs the PacketGold software just fine.
However, he's having
trouble - in fact it isn't working at all - getting the software to
interact with the PK232
via a standard Hayes modem cable for the Mac, via the Mac modem serial
port.

The PacketGold software reports: "Turn the modem off" and when he
complies, it reports
"Unable to find modem on any serial port.."

We have written to Apple, Interflex, and AEA about this, and are
waiting for responses.

We have Zterm, a basic terminal application for the Mac, but this
doesn't make the PK232
respond either.

Who has run the Quadra 610 DOS with packet, and how did you do it?
If you're using
a DOS 486 card on a Quadra 610 (or any Mac) to control a serial port
device, how is it working
out?

Please contact me via internet, (post a response if you like, but
please email directly to me as well) with suggestions or comments
regarding System 7 applications for packet on Macs
or his specific problem.

If you have a suggestion for who else to contact about this problem,
please speak up. Thanks.

Thanks for your help and 73.

I have the following Hamtronics kits for sale. They have been very neatly assembled, aligned and tested. They have been put in a deep-drawn seamless aluminum case which is RF-proof. To interface with the outside world, quality feedthru capacitors are used. These units were the RX/TX of my remote base, until the FCC took away the lower portion of 220.

220 MHz Receiver, with multi-stage helical resonator preamp front-end. Very sensitive and excellent s/n ratio - better than a handi-talkie!

220 MHz Transmitter, with multi-stage output filtering. Very clean and stable output. Both units are crystal-controlled and can accept an "oven" if rock-solid frequency stability is wanted.

Oh, I also have a Mirage mobile 220 MHz 20W amp (1-5 watts in). It has a switchable receiver preamp, and is in a very nice factory case with a large and rugged heatsink.

Interested parties mail me your checks yesterday!

3529. HAM GEAR DIVORCE SALE

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-12 05:03:05 UTC
From: lewiz@netcom.com
Message-ID: <lewizCuEop6.C0B@netcom.com>

Well, not really a divorce sale because I'm not married... yet the prices sure seem like it. I've got all this gear for sale:

Yaesu FT-2700RH Dual Band (144/440) Mobile Radio, complete with antenna duplexer, up/down DTMF mike, original box, and original receipt!! $350

Kenwood TK-310 commercial UHF handheld transceiver, with KNB-3 battery. This one covers the 450 band. No manual or battery charger. $150

Mirage C22A 220MHz 20W mobile AMP with Receiver Preamp. Tiny! $100

Henry S-20 220MHz 20W mobile AMP, no receiver preamp. Tiny! $ 75

Hamtronics TA-51 exciter, 220 MHz - great repeater/remote TX! $obo
Hamtronics RA-220 receiver, 220MHz - with helical resontors! $obo

Bearcat Thin Scan, 2 band 4 chan xtal control scanner, in box. $ 10

Icom IC-3AT 220 MHz Handi-talkie, with CTCSS unit and BP3 battery $175

Regency MX7000 Scanner, covers 25-550MHz and 800-1300 MHz! $100

Realistic TRC-448 SSB + AM mobile CB transceiver, excellent cond. $ 75

Kenwood TR-50 1200 MHz (1.2 Gig) portable transceivers (synth!). $250

Trident TR2400 super handheld scanner, 1000 ch, 100KHz-2060MHz. $435

Motorola P-10 commercial 154 MHz radio and charger base. $ 80

OKI 800 MHz duplexer, great separation. $ 15

FNN/Lotus QuoTrek Pocket Stock Quote Unit, battery & charger. $ 40

This is only the beginning... I vow to move without needing Bekins Vans.

>143 range for control link purposes.

Do they still use the 26.620 SSB anymore? Pennsylvania gave it up almost
entirely years ago. FM HT's have teeny weeny antennas; 11m radios had long
ugly ones which tended to break when you were walking through the woods.

I've ordered from the one in Texas and have no complaints. The radio I was looking to buy is regurarly $229, when it went on sale in the local RS for $149 I called US Radio and their sale price was $135 and they don't charge for sales tax or shipping. I ordered it and had it in a few days.

HELLO!!!

FOR SALE: Santec 440mhz HT model ST-7/R - Unit is about 10 years old and closely resembles an Icom 2AT or Icom 4AT in appearance and features. Puts out 2 watts on high power, covers the entire 440-450mhz range with synthesized mechanical thumbwheel tuning, has a new nicad battery pack, and includes manual and charger. Also includes touchtone pad for autopatch work. Very good condition.

I'll let it go for $75 + UPS shipping (money order).

> sticker.

> Does anyone have the complete listing ???????

Yep! I missed it earlier. It's right inside the front cover of the
service manual. Here's the table, rounded to the nearest MHz:

K North America
P Canada (as if it weren't in North America)
Tx 144-148 438-450
Rx 118-174 410-470

M "Other countries"
Tx & Rx 144-148 430-440

M2,M3 "Other countries"
M4 China
Tx 136-174 410-470
Rx 118-174 410-470

E,E3,E9 Europe
Tx & Rx 144-146 430-440

E2 Europe
Tx 136-174 410-470
Rx 118-174 410-470

The only difference between the K and P models seems to be that they
include different warranty cards: B46-0410-30(K) vs. B46-0422-00(P).

So... where are the country select bits? :-)

Hi Folks,

I am in need of a Manual for a oscilloscope that used to be sold by BALLENTINE
(based in New Jersy) but not manufactured by them.
The model number is 1042A(I assume it means 10MHz); It is a 2-channel scope.

A friend of mine hinted to me that some BNK Precision scopes are similar to the
one I have and maybe an old issue of Popular Electronics might have published some
info about the Ballentine scopes.

I appreciate any information on how to get a copy(hopefully inexpensive!).

PS. This is my first posting to a news group; If this message offended some hamsters
for posting it here, I appologize for that.
I would appreciate any hints on where to properly post such messages next time.

Thanks,
TES

: I'd like to hear people's comments - what you like, what you
: don't like, usability, audio quality on xmt and recv,
: intermod performance, bugs, etc.

I own and use a ft5200

: Also, I have some questions:

: 1) I believe both of these have a data jack on the back -
: correct? Does it support 9600bps?
not on the 5200
: 2) Can these be remotely controlled via DTMF? (Yes, I am
: aware of the legal issues involved.)
unknown
: 3) Are there any differences between these two other than
: the 5200 having dual in-band receive and 32 memories and
: the 5100 offering remote mounting and 94 memories? Do they
: take all of the same accessories?

The front panel on the 5200 may be removed and a cable added for remote ops.

The only outputs on the back of the 5200 is dual speaker jacks. This
allows you to mount dual speakers left and right. the received signal
comes out on the band you have switched in to that side. this allows
quick definition of what band / signal is being received without looking
at the radio..

: Repond by
posting or feel free to email me directly at : steveflu@microsoft.com.

: Thanks,
: Steve (Tech+ callsign on the way!)

Overall this has ben a trouble free excellent radio and I would not
hesitate to buy Yaesu again..

These are both work horses and would make OK rigs. I would go for the
Kenwood. Better yet, get a TS-830S which covers the WARC bands and has a
lot more features like IF shift/notch and variable bandwidth tuning.

I bought a TS-830S with the matching VFO-230 two years ago for $600.
It's a very nice rig.

You can do whatever you want to the radio, but it would be illegal to x-mit
out of band (even on a freq which you're commercially liscenced for) because
amateur radio equ. is not type accepted by the fcc.

Occasionally I post this hoping that someone has one.

I need a schematic or a full manual for a VU DATA mini scope model PS950B. This scope appears to be about 15 years old. Discrete components mostly. The CRT looks good, but no deflection. Don't have a manual or schematic for it. I bought this at Dayton about 3 years ago from a table inside where he had 8 or 10 for sale.

Will pay reasonable amount for manual or a copy of the schematic.

Thanks,

Jim Stafford, W4QO

3548. Working on TM-733 Mods.. anyone else?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-14 06:50:44 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Aug13235044@susie.vigra.com>
Source record: 224973

Out of curiosity, I've been trying to figure out how other variants of the Kenwood TM-733A can be easily "mutated" from the American "K" version. If you're one of those folks that gets their panties all in a bunch over the possibility of out-of-ham-band transmit, you can skip this article. I'm responsible for my own transmissions, as is anyone else.

Here's what I've come up with so far. I'm curious to know if anyone else has tinkered with this stuff. I figure since the radio is so new, every one out there is still under warranty, so there probably aren't many folks poking about with a soldering iron...

The K and P (Canadian) models seem physically identical so far. Only the warranty card has a different part number. Is there anything else I've missed?

The M2, M3, M4, and E2 models have the most liberal Tx frequency ranges: 136-174 & 410-470 MHz, instead of the US ("K") version's: 144-148 & 438-450.

The K version already has the widest 2m/70cm Rx range possible: 118-174 & 410-470, so there won't be any mods there.

The K and P models are lacking significant hunks of the 800 MHz Rx circuitry. In addition to some caps and inductors to link in the 800 MHz font end, IC202 is completely missing (the chip with "80R" output). I think it's a custom chip, so there's not much chance of finding one. ALL models other than K and P have this chip. If you're really desperate to get the 800 MHz Forbidden Band, you'll have to buy another radio, or try to order the chip from Kenwood Parts.

Also, K and P models have a "KCB20" for IC209 instead of KCB14. This is the "430 MHz Transmit Drive" chip. I think K is optimized for ~445 while the other is centered at ~435, but I'm guessing. The test/calibration instructions use different test frequencies for the two models, so there is probably some difference in the specs.

As for the CPU, it seems to detect which model it's in by reading pins 90 through 93 on power-up. (These are output lines to the DTMF encoder after power-up.) The pins are selectively pulled hi/low by wires and resistors to set the model.

If anyone knows how to override this setting by front-panel (software) controls, I'd be very interested to hear it!

As for hardware configuration, here's the info:

There are two wires (W1, W2) installed on the CPU board that apparently bypass resistors, tying the lines hi via 10k ohms (CP402 Rpack) instead of low via 100k resistors (CP403 Rpack). There are also three zero-ohm resistors that do something similar.

For those of you following along at home, that does indeed make five select lines, with only four going into the DTMF chip. :) I'm not sure about the fifth one, R413. It goes lots of places, including several dispersed pins on the CPU. It's only installed on the M4 (Chinese) model of the radio. Since the M4 model also uses a Chinese front-panel display, this line probably selects different glyphs and such. It's also tied into the descriptionless pin 77 of the CPU, called "RPT" (cross-band repeat?). Maybe they can't sell cross-banders in China.

The other four: W1/R410, W2/R411, R412, and R414 are the selectors that pull on the DTMF data lines. If we ignore the M4 and E models (which have more unique components), the K and M2/3 models have only these differences:

W1,2 R414
K,P Yes Yes
M2/3 No No

I'd bet one of those accounts for the different Tx range limits on the CPU. Maybe the other allows for 800 MHz frequency tuning.

So, is anyone else working towards mods for this radio, however useless?

Happy Hacking!
-Steve

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-14 07:03:43 UTC
From: struitt@ccwf.cc.utexas.edu
Message-ID: <struitt-1408940003430001@slip-5-1.ots.utexas.edu>
Source record: 224970

I recently purchased an old Regency 2 Meter mobile rig at a swap meet, It has six channels, and it requires one transmit and one recieve crystal per channel.
Fortunately I have some of the crystals, But I need to get four more, does anyone know of a good source for HAM crystals ?

3550. WORKING ON TM-733 MOD

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-14 09:45:07 UTC
From: kn4aq.gary@mms.raleigh.nc.us
Message-ID: <9408140945.0DP7D00@mms.raleigh.nc.us>
Source record: 224976

Ne> There are two wires (W1, W2) installed on the CPU board that
Ne> apparently bypass resistors, tying the lines hi via 10k ohms (CP402
Ne> Rpack) instead of low via 100k resistors (CP403 Rpack). There are
Ne> also three zero-ohm resistors that do something similar.

Ne> The other four: W1/R410, W2/R411, R412, and R414 are the selectors
Ne> that pull on the DTMF data lines. If we ignore the M4 and E models
Ne> (which have more unique components), the K and M2/3 models have only
Ne> these differences:

Ne> W1,2 R414
Ne> K,P Yes Yes
Ne> M2/3 No No

Ne> I'd bet one of those accounts for the different Tx range limits on the
Ne> CPU. Maybe the other allows for 800 MHz frequency tuning.

Ne> So, is anyone else working towards mods for this radio, however
Ne> useless?

I got a "Kenwood Supplementary Info" sheet from the dealer with my
733. It describes removing a chip resistor "B0," also identified as
R414, followed by resetting the CPU by holding the MR key and turning
on power, then pressing MR again.

It says that will open transmit from 136-173.995 MHz and 410-469.974
MHz, and receive from 118-173.995 MHz and 300-469-975 MHz. (I've seen
net bulletins that say it's not really receiving 300 MHz even if the
display is reading 300 MHz).

The sheet also shows "B1" (R-412), and two jumpers, B2 and B3 which
jumper solder pads right next to R-412 and R-414. The instructions
don't make any mention of doing anything with those parts.

Thanks to Steve for his early hacking, and especially writing about
the 733.

From: w5robert@blkbox.COM
Message-ID: <9408141339.aa11995@blkbox.COM>
Source record: 224981

Subject: Re: lists of lists
Frxom: Gene Spafford <spaf@cs.purdue.edu>
Status: RO

This is a form-letter reply from Spaf.
Last update, May 14, 1993.

I have received your inquiry concerning Usenet or newsgroups.
However, I am no longer involved with maintaining the periodic
postings or databases of this information, having "retired" from that
in April of 1993, after 11 years of that task; you must have missed my
postings about this.

In any event, the tasks have been picked up by others. If you are
writing about:

* lists of mailing lists, changes to exisiting mailing lists
(except the moderators' mailing list), or about how to
join or start existing lists, contact:
arielle@taronga.com (Stephanie da Silva)

* lists of newsgroups, lists of moderators, lists of distributions,
checkgroups messages, list of alternative hierarchies, or
changes to any of these, contact:
tale@uunet.uu.net (David Lawrence)
Also contact David if you have any questions on creating a new
newsgroup.

* information about Usenet history, software, configuration,
netiquette, rules, frequently asked questions (FAQs),
or other information not covered in the above points
contact:
netannounce@deshaw.com (Mark Moraes)

Many questions can be answered by consulting the most recent postings
in the news.announce.newusers and news.lists groups. If those
postings have expired from your site, or you do not get news, you can
get archived postings from the ftp server on rtfm.mit.edu
[18.172.1.58]

These archived postings include all the Frequently Asked Questions
posted to the news.answers newsgroups, as well as the most recent
lists of Usenet newsgroups, Usenet-accessible mailing lists, group
moderators, and other Usenet-related information posted to the
news.announce.newusers and news.lists groups.

To get the material by ftp, log in using anonymous ftp (userid of ftp
and your e-mail address as password).

The archived files, and FAQ files from other newsgroups, are all in
the directory
/pub/usenet/news.answers
Archived files from news.announce.newusers and news.lists are in
/pub/usenet/news.announce.newusers
/pub/usenet/news.lists
respectively.

To get the information by mail, send an e-mail message to
mail-server@rtfm.mit.edu containing:
send usenet/news.answers/TITLE/PART
where TITLE is the archive title, and PART is the portion of the
posting you want.

Send a message containing "help" to get general information about
the mail server, including information on how to get a list of archive
titles to use in further send commands.

Cheers,
--spaf

3557. SSTV ATV94 - how to pick up?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-14 20:11:30 UTC
From: copeland@metronet.com
Message-ID: <CuJK36.Jrs@metronet.com>
Source record: 224982
Cross-posted to: rec.radio.amateur.equipment,rec.radio.shortwave

I've been attempting to pick up SSTV on 14.230mhz using JVFAX 6.0.
It works ok on MARTIN and SCOTT, however some hams are using a format
called ATV 94 that JVFAX doesn't support.

Is there software out there to pick up ATV 94?

3558. AM airband problem on HT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-14 21:59:00 UTC
From: art.harris@woodybbs.com
Message-ID: <93.2900.7583.0NFB2DAA@woodybbs.com>
Source record: 224986

I modified my Alinco DJ-F1T to receive the AM aircraft band, and it sort of works. The problem is that the audio doesn't sound as clear as I'm accustomed to hearing on my scanner. Also, the sensitivity seems to be way down on AM. A friend who has a Kenwood HT has noticed the same thing.

Does anyone know how they demodulate AM on an HT? Is there a true AM detector or some short-cut method.

Any comments or ideas are welcome.

Source record: 224797

Hi all, I have 7, HF 5 band verticle antennas to sell or swap. They are from Maldol USA now located in Seattle Wa. All antennas are new in the box. They cover 3.5/7/14/21/28/Mhz approx 20 feet tall. They retail for $399.95 i will sell for $295 + $20 sh as these ants weigh 14lbs in the box. Or for the swap part I would be looking for good to v/good 2mtr mobiles, dual band mobiles, 2 mtr ht's and dual band ht's, preferable with boxes and manuals. Any interest please e-mail or call 408 274-7396 for more info or a fax of the spec sheet. 73 Doug

: I have aslo been told that the Storno 4000 series UHF H/held may be better for me as these have conversion details avilable..

I believe in the Icom U16 for UHF work. It's easily programmed and works perfect in ham bands. There is also the Icom H16 which I am looking for for VHF. I have abused my U16 over the years, I've even slamed the hood of a car on it once, accidently of course, and there is hardly a scratch on it. I've not had any non-user fixable problems with it.

The 5100 doesn't have the dual speaker jacks, nor is the front panel removable. It does offer dual in-band recieve, which I beleive the 5200 doesn't.

> Overall this has ben a trouble free excellent radio and I would not
> hesitate to buy Yaesu again..

Second that opinion for the 5100.

3576. TM-733 extended RF mod.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-15 16:12:00 UTC
From: st3qi@elroy.uh.edu
Message-ID: <15AUG199411125011@elroy.uh.edu>
Source record: 224799

I did the extended RF mod (remove R414) on my Kenwood TM-733 yesterday
and it works great. Will tx from 136 - 174, and about 415 - 465.

The design engineers at Kenwood REALLY have a sence of humor. When
resetting the CPU after the mod the radio plays a little musical jingle!

3578. "RF Power Labs, Inc." Linear Amps

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-15 16:59:15 UTC
From: hmaron@halcyon.com
Message-ID: <hmaron-150894095913@bellevue-ip43.halcyon.com>
Source record: 224800

I would appreciate any information regarding their linears, specifically
the
C500X. Any mods? Any way to get 10M coverage? Reliability. Service. I
understand the company had some problems and has reopened but no longer
does Ham gear.

From: duanev@pentagon.io.com
Message-ID: <32o96f$s46@pentagon.io.com>
Source record: 224801

Now that I know what the wide decimal point is for, does anyone know how to "encourage" the TH79 to specifically use FM or AM? Could this and the decimal point be a Kenwood "style" and thus similar on TH78s or others?

After reading earlier comments on the Radio Shack DSP on the Internet, then
reading QST's review of the unit in the July/August issue, I bought one.
Got it on sale, too...$69.95. While it does not have the adjustments
you'd find on some of the more sophisticated (and expensive!) units,
it does a WONDERFUL job of cutting out heterodynes, background noise,
etc. Works real well on SSB, and even though QST didn't seem to like
its CW performance, that's where I use mine the most, and it does
a good job there, too. If I had a lot of money, I'd get one of the
higher-priced ones, but this is a nice piece of equipment for a very
low price.

> > I just bought (or am in the process of buying) a power supply for my
> > HTX-202. However the power supply is 13.8VDC and 3A. I know the 202
>

I have used mine at home with an old CB type 12v rat shack power supply
(free), but I was told I was getting some hum in my audio during high power
transmit. I also discovered some detectable tvi on channel 11 on our tv
at home. (of course the tv antenna is pointed directly at the 2m antenna)

I switched to a camcorder battery, 12v - 2ah, and I have had no more complaints,
I think I am still getting about 5-6 watts and no more tvi, (a little tv
desense perhaps on initial keyup, but no more fuzzys)

I have another free CB P.S. this one is regulated, should not buzz a bit.

Source record: 224822

for some unknown reason, my ic-24 has gone belly-up.
the display shows signs of intelligence, the receiver
works fine, and the fm rf signal is generated, but not
amplified or fed to the antenna :(

now the question.......what is the best/fastest/cheapest
way to get it fixed? i seem to recall that icom has more
than one repair center. does anyone have any recommendations
as to which one to use? do you have to call for a return
authorization?

thanks for any responses, and 73.

The older Icom packs fit the HTX-202, but I have been using the Rayovac Renewal (R) batteries in the alkaline pack with very good results.

Until recently, it certainly looked like the Yaesu FT-530 was the one to beat. But I think if I were going to buy a dual-bander today, (and indeed, I have been thinking about it :-) I think I'd go with the new Kenwood TH-79A. Frankly, the alphanumeric display, which lets you program in names for the frequencies in the memories looks like a real winner. Too, I think I've always thought the Kenwoods have had somewhat nicer cosmetic design. Price of a 79A should be in the same ballpark (maybe +$25) as the other units you're considering if you shop carefully.

3597. [Q] Yaesu FT-530

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-16 06:52:41 UTC
From: Paul Antaki <pantaki@prodigy.bc.ca>
Message-ID: <32pnnp$el8@prodsql.prodigy.bc.ca>
Source record: 224821

I've just bought a Yaesu FT-530 and, since it's my first radio, I hace a couple of questions that I'm hoping someone can answer for me:

1. Since I had the mods done I can transmit in frequencies I'm not supposed to transmit in (e.g. Police frequencies). Is there any way I can turn transmit off on those frequencies alone? I've tried to do this by storing the PTT disable in the memory along with the frequency but it does not seem to be a setting that is set separately for each memory.

2. I'm concerned about how quickly the battery runs down. I got a little slip with the unit that says that the voltage display is .2 to .8 volts LOWER than the actual battery voltage. In the instruction manual it says that when the voltage hits 5.5 volts the battery pack should be recharged. The low battery indicator comes on when the display shows 5.5 volts even though (I presume) the actual voltage is a little higher. When transmitting, the battery voltage can dip significantly and cause the battery low indicator to flash. Is this the time to recharge or should I wait until the battery is low when receiving?

3. I'm using all the battery saving functions and I'm wondering if they really do make a difference.

4. Are there any cheap alternatives to buying Yaesu batteries/chargers for the FT-530?

5. What kind of antenna can I replace the standard one with to improve my transmit (instead of increasing wattage)?

If anyone can answer any of these questions I would be most grateful. If anyone has questions about the FT-530 I would be glad to try to answer them.

Many Thanks,

Paul

I read that it is possible to restrict the tx range to the ham bands while
still allowing wide rx. It is necessary to remove another jumper.
13?? 15?? I forget - and I haven't tried it.

One thing you could do, is program in a split tx frequency which is inside
the ham band. If you also set this memory to low power you won't do much
damage should you accidentally transmit.

Sorry I can't offer answers on your questions about batteries.

>5. What kind of antenna can I replace the standard one with to improve my
>transmit (instead of increasing wattage)?

There are telescoping antennas available - check the dealer or magazines,
I don't know a model number offhand.

The mod for the 530 can be for tx and rx or for rx only. Check with the place where the mod was done, they can change it to lock out the tx when the radio is out of band. It is one other jumper change to turn on this feature.

Charge the battery when it is low - not when the display flashes. This is only an indication that it is about time. It is best to let the battery go down before recharging.

The battery saver works, but you might not see a lot of difference, depending on how the radio is used. Lots of transmitting wipes the battery. The saver function is on rx, not tx.

Extra batteries can be purchased from W&W Associates. They advertise in most of the ham magazines and they usually go to the larger hamfests. My experienc with them has been excellent. (I can't say the same for Mr. Nicad). W&W makes batteries for Yaesu. Their price on the FNB25 is around $32 or so. They also make a very nice 1-hour charger which runs on 12 volts or on house current for around $85.

For an antenna, it depends on how much gain you want. The AEA Hot Rod works very well, but it is a solid, telescoping, base-loaded antenna with no flexibility. It really boosts the signal, however.

Hope this helps.

My Alinco DJ580T was modified for out of band transmit. I do have
some police repeater OUTPUTS saved in memory. What I do NOT store
is the repeater's offset and PL tone. That way, if I accidentally
DO key up, it will be on the repeater output WITHOUT PL. Now for
a question, do most police radios run with PL DECODE enabled?

Actually, with the Alinco (and probably the Yasesu as well), you
can store the PL but you do not have to actually enable it.
Then, the PL would be saved if (in a life or death emergency)
you really needed to transmit. Simply hitting PL enable along
with the offset would then get you in.

I know of no HT that allows "transmit disable" to be stored on a
memory by memory basis. Basically, if you cannot trust yourself
to avoid accidentally transmitting out of band, I'd put that
little jumper wire back! :-)

> port.
>

My guess is that while the Macintosh has a serial port that would make PC users green with envy (if they knew any better), the Mac serial port suffers for only having one input handshake and one output handshake line. So what do you connect the handshake lines to?

In the early days, before modems got the smarts and it became practical to use hardware flow control between the modem and the computer, most "modem" cables wired the Mac's input handshake to pin 5 (CTS) of a DB-25P, and the output handshake to pin 20 (DTR). Some put the input handshake on pin 6 (DSR).

The current wisdom is to leave the input handshake on CTS, but move the output handshake to RTS (pin 4). To make this work, sometimes you need to short pins 8 and 20 (DCD and DTR). Supra modems have a default setup for Macs (AT&F1) and "others" setup (AT&F2), the Mac parameters ignore DTR and DCD.

So what to do? If the PK232 supports a "3 wire serial cable", you can select that, and under Zterm's "Settings" menu select "Connection..." and turn off hardware handshake (if its turned on) and probably turn off software handshake too (this way control-s and control-q go all the way thru to the PK-232). This should get you running. Meanwhile you might consider cutting the DB-25P off your serial cable and wiring a new one in its place, or building a transition cable. At least experiment with the transition cable first. Male and female DB-25's, a couple of 1-1/2" or 2" #4 or #6 standoffs, and some wire, make a fine transition assembly.

Trust me, this is an end view of your mini-8 DIN connector:

6 7 8

3 4 5

1 2

Mini-8 DB-25P
1 4
2 5
3 2
4 7
5 3

Should produce a "Macintosh Hardware Handshake Modem Cable".

And, by any chance did you write your message in QUED/M, then "Break Lines"? If not, then it looks like it. QUED/M defaults to 87 character lines. Users of other systems seem to be limited to 80 character wide displays, so its not a bad idea to format text 75 or 76 characters/line so somebody later can quote you without making the reply wider than 80 characters/line.

3605. Lafeyette receiver documentation sought

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-16 15:27:17 UTC
From: dgs@53iss6.Waterloo.NCR.COM
Message-ID: <CuMw9H.37A@attwat.Waterloo.NCR.COM>
Source record: 224828
Cross-posted to: rec.radio.shortwave,rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.misc

Hi all... I posted about this over a year ago and had no joy. I have
a bit of new info and thought I would try again.

I have acquired a Lafeyette KT-340 (tube-type) SW receiver with no
documentation. I believe this model may have been the kit version of
some other Lafeyette radio (HA-??? I saw one once that looked identical
and now kick myself for not looking closer). Anyway, I will describe
the set and ask anyone with a model like this (or a hollow-state
reference book listing something like this) to contact me - even if
it is just with the model number of the factory built version.

The set has nine tubes (1 5Y3G, 1 6AQ5, 2 6AV6, 3 6BA6, 2 6BE6)
with at least 3 big 455KHz IF cans. The console has the following
controls (left to right): Function (off/AM/Send/Q-mult), AF Gain,
Selectivity (locks fully CW at "AM/SSB" marking), BFO-Q Multiplier,
Band (4 position), IF gain, Ant Trim, AVC/MVC, ANL. Glass dial above
with S-meter on left side and Main Tuning/Bandspread dials to the right.

If someone recognizes my poor orphan, give a shout. I would be most
grateful (and pay for) for a user manual, schematic or especially
service/alignment instructions or copy of same.

.............Dave

Set the transmit frequency to be invalid for the band you are on. The manual
tells how to do this. Then when you press the PTT the display will show
ERR instead of transmitting.
>
About batteries: the battery that comes with the 530 is small and good
for about a half day of my typical use. I bought the 1000 maH 7.2 V battery
and have been quite happy with it. The ham magazines have ads for third
party batteries.
>

>
That's a double edge sword. Use too good an antenna and the intermod increases
since you are receiving more signals. Use the rubber duck in fringe areas
and you won't have sufficent signal strength. The mail order places have
replacement antennas for sale, or wait for a hamfest in your area.

Source record: 224830

In article <32p28i$59s@jabba.cybernetics.net>,
tarumph@jabba.cybernetics.net (Tim Rumph) writes:

>What types of batteries are compatible with the HTX-202?

Battery packs for the 2/3/4 AT and 02/03/04 AT series of Icom HT's will
work with the HTX-202 and HTX-404.

Icom's numbers are BP2, BP3, BP5, BP7,BP8, and BP70.

Icom also makes a AA adaptor pack called the BP4, which will allow you to
charge NICADS if you use them (Don't try to charge alkalines in the
BP4...tends to damage equipment!)

I am using both HTX's and Icoms, and the batteries all work ok with each
other.

Hope this helps.

From: lwwald@lmsmgr.lerc.nasa.gov
Message-ID: <16AUG199413124375@lmsmgr.lerc.nasa.gov>
Source record: 224831

Hi, my name is Larry and my call is KE8GW. I have an ICOM 2410a
that exhibits an odd and intermittent problem. On the send and received
audio I get a low frequency rumble, much like the sound of the wind blowing
over the mic. This rumble doesnt seem to distort the regular audio but is
added to it. It mostly happens on the 2m side, but it may also occur on
the 440 side (I'm not sure). Has anyone ever experienced a problem like
this with their ICOM radio?
